Pinout Descriptions****DS099-4 (v1.5.1) August 24, 2004**
106 pages

- Pin Descriptions
 - Pin Behavior During Configuration
- Package Overview
- Pinout Tables
 - Footprints

IMPORTANT NOTE: *The Spartan-3 FPGA data sheet is created and published in separate modules. This complete version is provided for easy downloading and searching of the complete document. Page, figure, and table numbers begin at 1 for each module, and each module has its own Revision History at the end. Use the PDF "Bookmarks" for easy navigation in this volume.*

Introduction

The Spartan™-3 family of Field-Programmable Gate Arrays is specifically designed to meet the needs of high volume, cost-sensitive consumer electronic applications. The eight-member family offers densities ranging from 50,000 to five million system gates, as shown in [Table 1](#).

The Spartan-3 family builds on the success of the earlier Spartan-IIE family by increasing the amount of logic resources, the capacity of internal RAM, the total number of I/Os, and the overall level of performance as well as by improving clock management functions. Numerous enhancements derive from state-of-the-art Virtex™-II technology. These Spartan-3 enhancements, combined with advanced process technology, deliver more functionality and bandwidth per dollar than was previously possible, setting new standards in the programmable logic industry.

Because of their exceptionally low cost, Spartan-3 FPGAs are ideally suited to a wide range of consumer electronics applications, including broadband access, home networking, display/projection and digital television equipment.

The Spartan-3 family is a superior alternative to mask programmed ASICs. FPGAs avoid the high initial cost, the lengthy development cycles, and the inherent inflexibility of conventional ASICs. Also, FPGA programmability permits design upgrades in the field with no hardware replacement necessary, an impossibility with ASICs.

Features

- Revolutionary 90-nanometer process technology
- Very low cost, high-performance logic solution for high-volume, consumer-oriented applications

- Densities as high as 74,880 logic cells
- 326 MHz system clock rate
- Three power rails: for core (1.2V), I/Os (1.2V to 3.3V), and auxiliary purposes (2.5V)
- SelectIO™ signaling
 - Up to 784 I/O pins
 - 622 Mb/s data transfer rate per I/O
 - Seventeen single-ended signal standards
 - Seven differential signal standards including LVDS
 - Termination by Digitally Controlled Impedance
 - Signal swing ranging from 1.14V to 3.45V
 - Double Data Rate (DDR) support
- Logic resources
 - Abundant logic cells with shift register capability
 - Wide multiplexers
 - Fast look-ahead carry logic
 - Dedicated 18 x 18 multipliers
 - JTAG logic compatible with IEEE 1149.1/1532
- SelectRAM™ hierarchical memory
 - Up to 1,872 Kbits of total block RAM
 - Up to 520 Kbits of total distributed RAM
- Digital Clock Manager (up to four DCMs)
 - Clock skew elimination
 - Frequency synthesis
 - High resolution phase shifting
- Eight global clock lines and abundant routing
- Fully supported by Xilinx ISE development system
 - Synthesis, mapping, placement and routing
- MicroBlaze™ processor, PCI, and other cores
- Pb-free packaging options

Table 1: Summary of Spartan-3 FPGA Attributes

Device	System Gates	Logic Cells	CLB Array (One CLB = Four Slices)			Distributed RAM (bits ¹)	Block RAM (bits ¹)	Dedicated Multipliers	DCMs	Maximum User I/O	Maximum Differential I/O Pairs
			Rows	Columns	Total CLBs						
XC3S50	50K	1,728	16	12	192	12K	72K	4	2	124	56
XC3S200	200K	4,320	24	20	480	30K	216K	12	4	173	76

Notes:

1. By convention, one Kb is equivalent to 1,024 bits.

Architectural Overview

The Spartan-3 family architecture consists of five fundamental programmable functional elements:

- Configurable Logic Blocks (CLBs) contain RAM-based Look-Up Tables (LUTs) to implement logic and storage elements that can be used as flip-flops or latches. CLBs can be programmed to perform a wide variety of logical functions as well as to store data.
- Input/Output Blocks (IOBs) control the flow of data between the I/O pins and the internal logic of the device. Each IOB supports bidirectional data flow plus 3-state operation. Twenty-four different signal standards, including seven high-performance differential standards, are available as shown in [Table 2](#). Double Data-Rate (DDR) registers are included. The Digitally Controlled Impedance (DCI) feature provides automatic on-chip terminations, simplifying board designs.
- Block RAM provides data storage in the form of 18-Kbit dual-port blocks.

- Multiplier blocks accept two 18-bit binary numbers as inputs and calculate the product.
- Digital Clock Manager (DCM) blocks provide self-calibrating, fully digital solutions for distributing, delaying, multiplying, dividing, and phase shifting clock signals.

These elements are organized as shown in [Figure 1](#). A ring of IOBs surrounds a regular array of CLBs. The XC3S50 has a single column of block RAM embedded in the array. Those devices ranging from the XC3S200 to the XC3S2000 have two columns of block RAM. The XC3S4000 and XC3S5000 devices have four RAM columns. Each column is made up of several 18K-bit RAM blocks; each block is associated with a dedicated multiplier. The DCMs are positioned at the ends of the outer block RAM columns.

The Spartan-3 family features a rich network of traces and switches that interconnect all five functional elements, transmitting signals among them. Each functional element has an associated switch matrix that permits multiple connections to the routing.

Notes:

1. The two additional block RAM columns of the XC3S4000 and XC3S5000 devices are shown with dashed lines. The XC3S50 has only the block RAM column on the far left.

Figure 1: Spartan-3 Family Architecture

Configuration

Spartan-3 FPGAs are programmed by loading configuration data into robust static memory cells that collectively control all functional elements and routing resources. Before powering on the FPGA, configuration data is stored externally in a PROM or some other nonvolatile medium either on or off the board. After applying power, the configuration data is written to the FPGA using any of five different modes: Master Parallel, Slave Parallel, Master Serial, Slave Serial and Boundary Scan (JTAG). The Master and Slave Parallel modes use an 8-bit wide SelectMAP™ port.

The recommended memory for storing the configuration data is the low-cost Xilinx Platform Flash PROM family,

which includes the XCF00S PROMs for serial configuration and the higher density XCF00P PROMs for parallel or serial configuration.

I/O Capabilities

The SelectIO feature of Spartan-3 devices supports 17 single-ended standards and seven differential standards as listed in Table 2. Many standards support the DCI feature, which uses integrated terminations to eliminate unwanted signal reflections. Table 3 shows the number of user I/Os as well as the number of differential I/O pairs available for each device/package combination.

Table 2: Signal Standards Supported by the Spartan-3 Family

Standard Category	Description	V _{CCO} (V)	Class	Symbol	DCI Option
Single-Ended					
GTL	Gunning Transceiver Logic	N/A	Terminated	GTL	Yes
			Plus	GTLP	Yes
HSTL	High-Speed Transceiver Logic	1.5	I	HSTL_I	Yes
			III	HSTL_III	Yes
		1.8	I	HSTL_I_18	Yes
			II	HSTL_II_18	Yes
			III	HSTL_III_18	Yes
LVCMOS	Low-Voltage CMOS	1.2	N/A	LVCMOS12	No
		1.5	N/A	LVCMOS15	Yes
		1.8	N/A	LVCMOS18	Yes
		2.5	N/A	LVCMOS25	Yes
		3.3	N/A	LVCMOS33	Yes
LVTTTL	Low-Voltage Transistor-Transistor Logic	3.3	N/A	LVTTTL	No
PCI	Peripheral Component Interconnect	3.0	33 MHz	PCI33_3	No
SSTL	Stub Series Terminated Logic	1.8	N/A	SSTL18_I	Yes
		2.5	I	SSTL2_I	Yes
			II	SSTL2_II	Yes
Differential					
LDT (ULVDS)	Lightning Data Transport (HyperTransport™)	2.5	N/A	LDT_25	No
LVDS	Low-Voltage Differential Signaling		Standard	LVDS_25	Yes
			Bus	BLVDS_25	No
			Extended Mode	LVDSEXT_25	Yes
LVPECL	Low-Voltage Positive Emitter-Coupled Logic	2.5	N/A	LVPECL_25	No
RSDS	Reduced-Swing Differential Signaling	2.5	N/A	RSDS_25	No

Table 3: Spartan-3 I/O Chart

Notes:

1. All device options listed in a given package column are pin-compatible.

Package Marking

ds099-1_03_071304

Ordering Information

Spartan-3 FPGAs are available in both standard and Pb-free packaging options for all device/package combinations. The Pb-free packages include a special 'G' character in the ordering code.

Standard Packaging

Pb-Free Packaging

For additional information on Pb-free packaging, see [XAPP427: Xilinx Lead Free Packages](#).

Device	Speed Grade	Package Type / Number of Pins		Temperature Range (T_j)	
XC3S50	-4 Standard Performance	VQ(G)100	100-pin Very Thin Quad Flat Pack (VQFP)	C	Commercial (0°C to 85°C)
XC3S200	-5 High Performance ¹	TQ(G)144	144-pin Thin Quad Flat Pack (TQFP)	I	Industrial (-40°C to 100°C)
XC3S400		PQ(G)208	208-pin Plastic Quad Flat Pack (PQFP)		
XC3S1000		FT(G)256	256-ball Fine-Pitch Thin Ball Grid Array (FTBGA)		
XC3S1500		FG(G)320	320-ball Fine-Pitch Ball Grid Array (FBGA)		
XC3S2000		FG(G)456	456-ball Fine-Pitch Ball Grid Array (FBGA)		
XC3S4000		FG(G)676	676-ball Fine-Pitch Ball Grid Array (FBGA)		
XC3S5000		FG(G)900	900-ball Fine-Pitch Ball Grid Array (FBGA)		
		FG(G)1156	1156-ball Fine-Pitch Ball Grid Array (FBGA)		

Notes:

1. The -5 speed grade is exclusively available in the Commercial temperature range.

Revision History

Date	Version No.	Description
04/11/03	1.0	Initial Xilinx release.
04/24/03	1.1	Updated block RAM, DCM, and multiplier counts for the XC3S50.
12/24/03	1.2	Added the FG320 package.
07/13/04	1.3	Added information on Pb-free packaging options.

IOBs

IOB Overview

The Input/Output Block (IOB) provides a programmable, bidirectional interface between an I/O pin and the FPGA's internal logic.

A simplified diagram of the IOB's internal structure appears in [Figure 1](#). There are three main signal paths within the IOB: the output path, input path, and 3-state path. Each path has its own pair of storage elements that can act as either registers or latches. For more information, see the Storage Element Functions section. The three main signal paths are as follows:

- The input path carries data from the pad, which is bonded to a package pin, through an optional programmable delay element directly to the I line. After the delay element, there are alternate routes through a pair of storage elements to the IQ1 and IQ2 lines. The IOB outputs I, IQ1, and IQ2 all lead to the FPGA's internal logic. The delay element can be set to ensure a hold time of zero.
- The output path, starting with the O1 and O2 lines, carries data from the FPGA's internal logic through a multiplexer and then a three-state driver to the IOB pad. In addition to this direct path, the multiplexer provides the option to insert a pair of storage elements.
- The 3-state path determines when the output driver is high impedance. The T1 and T2 lines carry data from

the FPGA's internal logic through a multiplexer to the output driver. In addition to this direct path, the multiplexer provides the option to insert a pair of storage elements.

- All signal paths entering the IOB, including those associated with the storage elements, have an inverter option. Any inverter placed on these paths is automatically absorbed into the IOB.

Storage Element Functions

There are three pairs of storage elements in each IOB, one pair for each of the three paths. It is possible to configure each of these storage elements as an edge-triggered D-type flip-flop (FD) or a level-sensitive latch (LD).

The storage-element-pair on either the Output path or the Three-State path can be used together with a special multiplexer to produce Double-Data-Rate (DDR) transmission. This is accomplished by taking data synchronized to the clock signal's rising edge and converting them to bits synchronized on both the rising and the falling edge. The combination of two registers and a multiplexer is referred to as a Double-Data-Rate D-type flip-flop (FDDR).

See [Double-Data-Rate Transmission](#), page 3 for more information.

The signal paths associated with the storage element are described in [Table 1](#).

Table 1: Storage Element Signal Description

Storage Element Signal	Description	Function
D	Data input	Data at this input is stored on the active edge of CK enabled by CE. For latch operation when the input is enabled, data passes directly to the output Q.
Q	Data output	The data on this output reflects the state of the storage element. For operation as a latch in transparent mode, Q will mirror the data at D.
CK	Clock input	A signal's active edge on this input with CE asserted, loads data into the storage element.
CE	Clock Enable input	When asserted, this input enables CK. If not connected, CE defaults to the asserted state.
SR	Set/Reset	Forces storage element into the state specified by the SRHIGH/SRLOW attributes. The SYNC/ASYNC attribute setting determines if the SR input is synchronized to the clock or not.
REV	Reverse	Used together with SR. Forces storage element into the state opposite from what SR does.

Note: All IOB signals communicating with the FPGA's internal logic have the option of inverting polarity.

DS099-2_01_082104

Figure 1: Simplified IOB Diagram

According to [Figure 1](#), the clock line OTCLK1 connects the CK inputs of the upper registers on the output and three-state paths. Similarly, OTCLK2 connects the CK inputs for the lower registers on the output and three-state paths. The upper and lower registers on the input path have independent clock lines: ICLK1 and ICLK2.

The enable line OCE connects the CE inputs of the upper and lower registers on the output path. Similarly, TCE connects the CE inputs for the register pair on the three-state

path and ICE does the same for the register pair on the input path.

The Set/Reset (SR) line entering the IOB is common to all six registers, as is the Reverse (REV) line.

Each storage element supports numerous options in addition to the control over signal polarity described in the IOB Overview section. These are described in [Table 2](#).

Table 2: Storage Element Options

Option Switch	Function	Specificity
FF/Latch	Chooses between an edge-sensitive flip-flop or a level-sensitive latch	Independent for each storage element.
SYNC/ASYN	Determines whether SR is synchronous or asynchronous	Independent for each storage element.
SRHIGH/SRLOW	Determines whether SR acts as a Set, which forces the storage element to a logic "1" (SRHIGH) or a Reset, which forces a logic "0" (SRLOW).	Independent for each storage element, except when using FDDR. In the latter case, the selection for the upper element (OFF1 or TFF2) will apply to both elements.
INIT1/INIT0	In the event of a Global Set/Reset, after configuration or upon activation of the GTS net, this switch decides whether to set or reset a storage element. By default, choosing SRLOW also selects INIT0; choosing SRHIGH also selects INIT1.	Independent for each storage element, except when using FDDR. In the latter case, selecting INIT0 for one element applies to both elements (even though INIT1 is selected for the other).

Double-Data-Rate Transmission

Double-Data-Rate (DDR) transmission describes the technique of synchronizing signals to both the rising and falling edges of the clock signal. Spartan-3 devices use register-pairs in all three IOB paths to perform DDR operations.

The pair of storage elements on the IOB's Output path (OFF1 and OFF2), used as registers, combine with a special multiplexer to form a DDR D-type flip-flop (FDDR). This primitive permits DDR transmission where output data bits are synchronized to both the rising and falling edges of a clock. It is possible to access this function by placing either an FDDRSE or an FDDRCPE component or symbol into the design. DDR operation requires two clock signals (50% duty cycle), one the inverted form of the other. These signals trigger the two registers in alternating fashion, as shown in [Figure 2](#). Commonly, the Digital Clock Manager (DCM) generates the two clock signals by mirroring an incoming signal, then shifting it 180 degrees. This approach ensures minimal skew between the two signals.

The storage-element-pair on the Three-State path (TFF1 and TFF2) can also be combined with a local multiplexer to form an FDDR primitive. This permits synchronizing the output enable to both the rising and falling edges of a clock. This DDR operation is realized in the same way as for the output path.

The storage-element-pair on the input path (IFF1 and IFF2) allows an I/O to receive a DDR signal. An incoming DDR clock signal triggers one register and the inverted clock signal triggers the other register. In this way, the registers take turns capturing bits of the incoming DDR data signal.

Aside from high bandwidth data transfers, DDR can also be used to reproduce, or "mirror", a clock signal on the output. This approach is used to transmit clock and data signals together. A similar approach is used to reproduce a clock signal at multiple outputs. The advantage for both approaches is that skew across the outputs will be minimal.

Figure 2: Clocking the DDR Register

Pull-Up and Pull-Down Resistors

The optional pull-up and pull-down resistors are intended to establish High and Low levels, respectively, at unused I/Os. The pull-up resistor optionally connects each IOB pad to V_{CCO} . A pull-down resistor optionally connects each pad to GND. These resistors are placed in a design using the PULLUP and PULLDOWN symbols in a schematic, respectively. They can also be instantiated as components, set as constraints or passed as attributes in HDL code. These resistors can also be selected for all unused I/O using the Bitstream Generator (BitGen) option UnusedPin. A Low logic level on HSWAP_EN activates the pull-up resistors on all I/Os during configuration.

Keeper Circuit

Each I/O has an optional keeper circuit that retains the last logic level on a line after all drivers have been turned off. This is useful to keep bus lines from floating when all connected drivers are in a high-impedance state. This function is placed in a design using the KEEPER symbol. Pull-up and pull-down resistors override the keeper circuit.

ESD Protection

Clamp diodes protect all device pads against damage from Electro-Static Discharge (ESD) as well as excessive voltage transients. Each I/O has two clamp diodes: One diode extends P-to-N from the pad to V_{CCO} and a second diode extends N-to-P from the pad to GND. During operation, these diodes are normally biased in the off state. These clamp diodes are always connected to the pad, regardless

of the signal standard selected. The presence of diodes limits the ability of Spartan-3 I/Os to tolerate high signal voltages. The V_{IN} absolute maximum rating in Table 1 in Module 3: **DC and Switching Characteristics** specifies the voltage range that I/Os can tolerate.

Slew Rate Control and Drive Strength

Two options, FAST and SLOW, control the output slew rate. The FAST option supports output switching at a high rate. The SLOW option reduces bus transients. These options are only available when using one of the LVCMOS or LVTTTL standards, which also provide up to seven different levels of current drive strength: 2, 4, 6, 8, 12, 16, and 24 mA. Choosing the appropriate drive strength level is yet another means to minimize bus transients.

Table 3 shows the drive strengths that the LVCMOS and LVTTTL standards support. The Fast option is indicated by appending an "F" attribute after the output buffer symbol OBUF or the bidirectional buffer symbol IOBUF. The Slow option appends an "S" attribute. The drive strength in milliamperes follows the slew rate attribute. For example, OBUF_LVCMOS18_S_6 or IOBUF_LVCMOS25_F_16.

Table 3: Programmable Output Drive Current

Signal Standard	Current Drive (mA)						
	2	4	6	8	12	16	24
LVCMOS12	✓	✓	✓	-	-	-	-
LVCMOS15	✓	✓	✓	✓	✓	-	-
LVCMOS18	✓	✓	✓	✓	✓	✓	-
LVCMOS25	✓	✓	✓	✓	✓	✓	✓
LVCMOS33	✓	✓	✓	✓	✓	✓	✓
LVTTTL	✓	✓	✓	✓	✓	✓	✓

Boundary-Scan Capability

All Spartan-3 IOBs support boundary-scan testing compatible with IEEE 1149.1 standards. See **Boundary-Scan (JTAG) Mode**, page 36 for more information.

SelectIO Signal Standards

The IOBs support 17 different single-ended signal standards, as listed in Table 4. Furthermore, the majority of IOBs can be used in specific pairs supporting any of six differential signal standards, as shown in Table 5. The desired standard is selected by placing the appropriate I/O library symbol or component into the FPGA design. For example, the symbol named IOBUF_LVCMOS15_F_8 represents a bidirectional I/O to which the 1.5V LVCMOS signal standard has been assigned. The slew rate and current drive are set to Fast and 8 mA, respectively.

Together with placing the appropriate I/O symbol, two externally applied voltage levels, V_{CCO} and V_{REF} select the desired signal standard. The V_{CCO} lines provide current to the output driver. The voltage on these lines determines the

output voltage swing for all standards except GTL and GTLP.

All single-ended standards except the LVCMOS, LVTTTL, and PCI varieties require a Reference Voltage (V_{REF}) to bias the input-switching threshold. Once a configuration data file is loaded into the FPGA that calls for the I/Os of a given bank to use such a signal standard, a few specifically reserved I/O pins on the same bank automatically convert to V_{REF} inputs. When using one of the LVCMOS standards, these pins remain I/Os because the V_{CCO} voltage biases the input-switching threshold, so there is no need for V_{REF} . Select the V_{CCO} and V_{REF} levels to suit the desired single-ended standard according to [Table 4](#).

Differential standards employ a pair of signals, one the opposite polarity of the other. The noise canceling (e.g., Common-Mode Rejection) properties of these standards permit exceptionally high data transfer rates. This section introduces the differential signaling capabilities of Spartan-3 devices.

Each device-package combination designates specific I/O pairs that are specially optimized to support differential standards. A unique “L-number”, part of the pin name, identifies the line-pairs associated with each bank (see [Module 4: Pinout Descriptions](#)). For each pair, the letters “P” and “N” designate the true and inverted lines, respectively. For example, the pin names IO_L43P_7 and IO_L43N_7 indicate the true and inverted lines comprising the line pair L43 on Bank 7. The V_{CCO} lines provide current to the outputs. The V_{REF} lines are not used. Select the V_{CCO} level to suit the desired differential standard according to [Table 5](#).

Table 4: Single-Ended I/O Standards (Values in Volts)

Signal Standard	V_{CCO}		V_{REF} for Inputs ⁽¹⁾	Board Termination Voltage (V_{TT})
	For Outputs	For Inputs		
GTL	Note 2	Note 2	0.8	1.2
GTLP	Note 2	Note 2	1	1.5
HSTL_I	1.5	-	0.75	0.75
HSTL_III	1.5	-	0.9	1.5
HSTL_I_18	1.8	-	0.9	0.9
HSTL_II_18	1.8	-	0.9	0.9
HSTL_III_18	1.8	-	1.1	1.8
LVCMOS12	1.2	1.2	-	-
LVCMOS15	1.5	1.5	-	-
LVCMOS18	1.8	1.8	-	-
LVCMOS25	2.5	2.5	-	-
LVCMOS33	3.3	3.3	-	-
LVTTTL	3.3	3.3	-	-
PCI33_3	3.0	3.0	-	-
SSTL18_I	1.8	-	0.9	0.9

Table 4: Single-Ended I/O Standards (Values in Volts)

Signal Standard	V_{CCO}		V_{REF} for Inputs ⁽¹⁾	Board Termination Voltage (V_{TT})
	For Outputs	For Inputs		
SSTL2_I	2.5	-	1.25	1.25
SSTL2_II	2.5	-	1.25	1.25

Notes:

1. Banks 4 and 5 of any Spartan-3 device in a VQ100 package do not support signal standards using V_{REF} .
2. The V_{CCO} level used for the GTL and GTLP standards must be no lower than the termination voltage (V_{TT}), nor can it be lower than the voltage at the I/O pad.
3. See [Table 6](#) for a listing of the single-ended DCI standards.

Table 5: Differential I/O Standards

Signal Standard	V_{CCO} (Volts)		V_{REF} for Inputs (Volts)
	For Outputs	For Inputs	
LDT_25 (ULVDS_25)	2.5	-	-

Notes:

1. See [Table 6](#) for a listing of the differential DCI standards.

The need to supply V_{REF} and V_{CCO} imposes constraints on which standards can be used in the same bank. See [The Organization of IOBs into Banks](#) section for additional guidelines concerning the use of the V_{CCO} and V_{REF} lines.

Digitally Controlled Impedance (DCI)

When the round-trip delay of an output signal — i.e., from output to input and back again — exceeds rise and fall times, it is common practice to add termination resistors to the line carrying the signal. These resistors effectively match the impedance of a device’s I/O to the characteristic impedance of the transmission line, thereby preventing reflections that adversely affect signal integrity. However, with the high I/O counts supported by modern devices, adding resistors requires significantly more components and board area. Furthermore, for some packages — e.g., ball grid arrays — it may not always be possible to place resistors close to pins.

DCI answers these concerns by providing two kinds of on-chip terminations: Parallel terminations make use of an integrated resistor network. Series terminations result from controlling the impedance of output drivers. DCI actively adjusts both parallel and series terminations to accurately match the characteristic impedance of the transmission line. This adjustment process compensates for differences in I/O impedance that can result from normal variation in the ambient temperature, the supply voltage and the manufac-

turing process. When the output driver turns off, the series termination, by definition, approaches a very high impedance; in contrast, parallel termination resistors remain at the targeted values.

DCI is available only for certain I/O standards, as listed in [Table 6](#). DCI is selected by applying the appropriate I/O

standard extensions to symbols or components. There are five basic ways to configure terminations, as shown in [Table 7](#). The DCI I/O standard determines which of these terminations is put into effect.

Table 6: DCI I/O Standards

Category of Signal Standard	Signal Standard	V _{CCO} (V)		V _{REF} for Inputs (V)	Termination Type	
		For Outputs	For Inputs		At Output	At Input
Single-Ended						
Gunning Transceiver Logic	GTL_DCI	1.2	1.2	0.8	Single	Single
	GTLP_DCI	1.5	1.5	1.0		
High-Speed Transceiver Logic	HSTL_I_DCI	1.5	1.5	0.75	None	Split

Notes:

1. The value of R is equivalent to the characteristic impedance of the line connected to the I/O. It is also equal to half the value of R_{REF} for the DV2 standards and R_{REF} for all other DCI standards.
2. For DCI using HSTL Classes I and III, terminations only go into effect at inputs (not at outputs).
3. For DCI using SSTL Class I, the split termination only goes into effect at inputs (not at outputs).

The DCI feature operates independently for each of the device's eight banks. Each bank has an "N" reference pin (VRN) and a "P" reference pin, (VRP), to calibrate driver and termination resistance. Only when using a DCI standard on a given bank do these two pins function as VRN and VRP. When not using a DCI standard, the two pins function as user I/Os. As shown in [Figure 3](#), add an external reference resistor to pull the VRN pin up to V_{CCO} and another reference resistor to pull the VRP pin down to GND. Both resistors have the same value — commonly 50 Ohms — with one-percent tolerance, which is either the characteristic impedance of the line or twice that, depending on the DCI standard in use. Standards having a symbol name that contains the letters "DV2" use a reference resistor value that is twice the line impedance. DCI adjusts the output driver impedance to match the reference resistors' value or half that, according to the standard. DCI always adjusts the on-chip termination resistors to directly match the reference resistors' value.

Figure 3: Connection of Reference Resistors (R_{REF})

The rules guiding the use of DCI standards on banks are as follows:

1. No more than one DCI I/O standard with a Single Termination is allowed per bank.
2. No more than one DCI I/O standard with a Split Termination is allowed per bank.
3. Single Termination, Split Termination, Controlled-Impedance Driver, and Controlled-Impedance Driver with Half Impedance can co-exist in the same bank.

See also [The Organization of IOBs into Banks](#), page 8.

The Organization of IOBs into Banks

IOBs are allocated among eight banks, so that each side of the device has two banks, as shown in [Figure 4](#). For all packages, each bank has independent V_{REF} lines. For example, V_{REF} Bank 3 lines are separate from the V_{REF} lines going to all other banks.

For the Very Thin Quad Flat Pack (VQ), Plastic Quad Flat Pack (PQ), Fine Pitch Thin Ball Grid Array (FT), and Fine Pitch Ball Grid Array (FG) packages, each bank has dedicated V_{CCO} lines. For example, the V_{CCO} Bank 7 lines are separate from the V_{CCO} lines going to all other banks. Thus,

Spartan-3 devices in these packages support eight independent V_{CCO} supplies.

DS099-2_03_082104

Figure 4: Spartan-3 I/O Banks (top view)

In contrast, the 144-pin Thin Quad Flat Pack (TQ144) package ties V_{CCO} together internally for the pair of banks on each side of the device. For example, the V_{CCO} Bank 0 and the V_{CCO} Bank 1 lines are tied together. The interconnected bank-pairs are 0/1, 2/3, 4/5, and 6/7. As a result, Spartan-3 devices in the TQ144 package support four independent V_{CCO} supplies.

Spartan-3 Compatibility

Within the Spartan-3 family, all devices are pin-compatible by package. When the need for future logic resources outgrows the capacity of the Spartan-3 device in current use, a larger device in the same package can serve as a direct replacement. Larger devices may add extra V_{REF} and V_{CCO} lines to support a greater number of I/Os. In the larger device, more pins can convert from user I/Os to V_{REF} lines. Also, additional V_{CCO} lines are bonded out to pins that were "not connected" in the smaller device. Thus, it is important to plan for future upgrades at the time of the board's initial design by laying out connections to the extra pins.

The Spartan-3 family is not pin-compatible with any previous Xilinx FPGA family.

Rules Concerning Banks

When assigning I/Os to banks, it is important to follow the following V_{CCO} rules:

1. Leave no V_{CCO} pins unconnected on the FPGA.
2. Set all V_{CCO} lines associated with the (interconnected) bank to the same voltage level.
3. The V_{CCO} levels used by all standards assigned to the I/Os of the (interconnected) bank(s) must agree. The Xilinx development software checks for this. [Tables 4, 5, and 6](#) describe how different standards use the V_{CCO} supply.

4. If none of the standards assigned to the I/Os of the (interconnected) bank(s) use V_{CCO} , tie all associated V_{CCO} lines to 2.5V.
5. In general, apply 2.5V to V_{CCO} Bank 4 from power-on to the end of configuration. Apply the same voltage to V_{CCO} Bank 5 during parallel configuration or a Readback operation. For information on how to program the FPGA using 3.3V signals and power, see the **3.3V-Tolerant Configuration Interface** section.

If any of the standards assigned to the Inputs of the bank use V_{REF} then observe the following additional rules:

1. Leave no V_{REF} pins unconnected on any bank.
2. Set all V_{REF} lines associated with the bank to the same voltage level.
3. The V_{REF} levels used by all standards assigned to the Inputs of the bank must agree. The Xilinx development software checks for this. Tables 4 and 6 describe how different standards use the V_{REF} supply.

If none of the standards assigned to the Inputs of a bank use V_{REF} for biasing input switching thresholds, all associated V_{REF} pins function as User I/Os.

Exceptions to Banks Supporting I/O Standards

Bank 5 of any Spartan-3 device in a VQ100 or TQ144 package does not support DCI signal standards. In this case, bank 5 has neither VRN nor VRP pins.

Furthermore, banks 4 and 5 of any Spartan-3 device in a VQ100 package do not support signal standards using V_{REF} (see Table 4). In this case, the two banks do not have any V_{REF} pins.

Supply Voltages for the IOBs

Three different supplies power the IOBs:

1. The V_{CCO} supplies, one for each of the FPGA's I/O banks, power the output drivers, except when using the GTL and GTLP signal standards. The voltage on the V_{CCO} pins determines the voltage swing of the output signal.
2. V_{CCINT} is the main power supply for the FPGA's internal logic.
3. The V_{CCAUX} is an auxiliary source of power, primarily to optimize the performance of various FPGA functions such as I/O switching.

The I/Os During Power-On, Configuration, and User Mode

With no power applied to the FPGA, all I/Os are in a high-impedance state. The V_{CCINT} (1.2V), V_{CCAUX} (2.5V), and V_{CCO} supplies may be applied in any order. Before power-on can finish, V_{CCINT} , V_{CCO} Bank 4, and V_{CCAUX} must have reached their respective minimum recommended operating levels (see Table 2 in Module 3: **DC and Switching Characteristics**). At this time, all I/O drivers also will be in a high-impedance state. V_{CCO} Bank 4, V_{CCINT} , and V_{CCAUX} serve as inputs to the internal Power-On Reset circuit (POR).

A Low level applied to the HSWAP_EN input enables pull-up resistors on User I/Os from power-on throughout configuration. A High level on HSWAP_EN disables the pull-up resistors, allowing the I/Os to float. As soon as power is applied, the FPGA begins initializing its configuration memory. At the same time, the FPGA internally asserts the Global Set-Reset (GSR), which asynchronously resets all IOB storage elements to a Low state.

Upon the completion of initialization, INIT_B goes High, sampling the M0, M1, and M2 inputs to determine the configuration mode. At this point, the configuration data is loaded into the FPGA. The I/O drivers remain in a high-impedance state (with or without pull-up resistors, as determined by the HSWAP_EN input) throughout configuration.

The Global Three State (GTS) net is released during Start-Up, marking the end of configuration and the beginning of design operation in the User mode. At this point, those I/Os to which signals have been assigned go active while all unused I/Os remain in a high-impedance state. The release of the GSR net, also part of Start-up, leaves the IOB registers in a Low state by default, unless the loaded design reverses the polarity of their respective RS inputs.

In User mode, all internal pull-up resistors on the I/Os are disabled and HSWAP_EN becomes a "don't care" input. If it is desirable to have pull-up or pull-down resistors on I/Os carrying signals, the appropriate symbol — e.g., PULLUP, PULLDOWN — must be placed at the appropriate pads in the design. The Bitstream Generator (Bitgen) option UnusedPin available in the Xilinx development software determines whether unused I/Os collectively have pull-up resistors, pull-down resistors, or no resistors in User mode.

Figure 5: Arrangement of Slices within the CLB

CLB Overview

The Configurable Logic Blocks (CLBs) constitute the main logic resource for implementing synchronous as well as combinatorial circuits. Each CLB comprises four interconnected slices, as shown in Figure 5. These slices are grouped in pairs. Each pair is organized as a column with an independent carry chain.

The nomenclature that the FPGA Editor — part of the Xilinx development software — uses to designate slices is as follows: The letter "X" followed by a number identifies columns of slices. The "X" number counts up in sequence from the left side of the die to the right. The letter "Y" followed by a number identifies the position of each slice in a pair as well as indicating the CLB row. The "Y" number counts slices starting from the bottom of the die according to the sequence: 0, 1, 0, 1 (the first CLB row); 2, 3, 2, 3 (the second CLB row); etc. Figure 5 shows the CLB located in the lower left-hand corner of the die. Slices X0Y0 and X0Y1 make up the column-pair on the left where as slices X1Y0 and X1Y1 make up the column-pair on the right. For each CLB, the term "left-hand" (or SLICEM) is used to indicate the pair of slices labeled with an even "X" number, such as X0, and the term "right-hand" (or SLICEL) designates the pair of slices with an odd "X" number, e.g., X1.

Elements Within a Slice

All four slices have the following elements in common: two logic function generators, two storage elements, wide-function multiplexers, carry logic, and arithmetic gates, as shown in Figure 6. Both the left-hand and right-hand slice pairs use these elements to provide logic, arithmetic, and

ROM functions. Besides these, the left-hand pair supports two additional functions: storing data using Distributed RAM and shifting data with 16-bit registers. Figure 6 is a diagram of the left-hand slice; therefore, it represents a superset of the elements and connections to be found in all slices. See [Function Generator](#), page 12 for more information.

The RAM-based function generator — also known as a Look-Up Table or LUT — is the main resource for implementing logic functions. Furthermore, the LUTs in each left-hand slice pair can be configured as Distributed RAM or a 16-bit shift register. For information on the former, see [XAPP464: Using Look-Up Tables as Distributed RAM in Spartan-3 FPGAs](#); for information on the latter, refer to [XAPP465: Using Look-Up Tables as Shift Registers \(SRL16\) in Spartan-3 FPGAs](#). The function generators located in the upper and lower portions of the slice are referred to as the "G" and "F", respectively.

The storage element, which is programmable as either a D-type flip-flop or a level-sensitive latch, provides a means for synchronizing data to a clock signal, among other uses. The storage elements in the upper and lower portions of the slice are called FFY and FFX, respectively.

Wide-function multiplexers effectively combine LUTs in order to permit more complex logic operations. Each slice has two of these multiplexers with F5MUX in the lower portion of the slice and FXMUX in the upper portion. Depending on the slice, FXMUX takes on the name F6MUX, F7MUX, or F8MUX. For more details on the multiplexers, see [XAPP466: Using Dedicated Multiplexers in Spartan-3 FPGAs](#).

DS099-2_06_041103

Notes:

- Options to invert signal polarity as well as other options that enable lines for various functions are not shown.
- The index *i* can be 6, 7, or 8, depending on the slice. In this position, the upper right-hand slice has an F8MUX, and the upper left-hand slice has an F7MUX. The lower right-hand and left-hand slices both have an F6MUX.

Figure 6: Simplified Diagram of the Left-Hand SLICEM

The carry chain, together with various dedicated arithmetic logic gates, support fast and efficient implementations of math operations. The carry chain enters the slice as CIN and exits as COUT. Five multiplexers control the chain: CYINIT, CY0F, and CYMUXF in the lower portion as well as CY0G and CYMUXG in the upper portion. The dedicated arithmetic logic includes the exclusive-OR gates XORF and XORG (upper and lower portions of the slice, respectively) as well as the AND gates GAND and FAND (upper and lower portions, respectively).

Main Logic Paths

Central to the operation of each slice are two nearly identical data paths, distinguished using the terms *top* and *bottom*. The description that follows uses names associated with the bottom path. (The top path names appear in parentheses.) The basic path originates at an interconnect-switch matrix outside the CLB. Four lines, F1 through F4 (or G1 through G4 on the upper path), enter the slice and connect directly to the LUT. Once inside the slice, the lower 4-bit path passes through a function generator "F" (or "G") that performs logic operations. The function generator's Data output, "D", offers five possible paths:

1. Exit the slice via line "X" (or "Y") and return to interconnect.
2. Inside the slice, "X" (or "Y") serves as an input to the DXMUX (DYMUX) which feeds the data input, "D", of the FFY (FFX) storage element. The "Q" output of the storage element drives the line XQ (or YQ) which exits the slice.
3. Control the CYMUXF (or CYMUXG) multiplexer on the carry chain.
4. With the carry chain, serve as an input to the XORF (or XORG) exclusive-OR gate that performs arithmetic operations, producing a result on "X" (or "Y").
5. Drive the multiplexer F5MUX to implement logic functions wider than four bits. The "D" outputs of both the F-LUT and G-LUT serve as data inputs to this multiplexer.

In addition to the main logic paths described above, there are two bypass paths that enter the slice as BX and BY. Once inside the FPGA, BX in the bottom half of the slice (or BY in the top half) can take any of several possible branches:

1. Bypass both the LUT and the storage element, then exit the slice as BXOUT (or BYOUT) and return to interconnect.
2. Bypass the LUT, then pass through a storage element via the D input before exiting as XQ (or YQ).
3. Control the wide function multiplexer F5MUX (or F6MUX).
4. Via multiplexers, serve as an input to the carry chain.

5. Drives the DI input of the LUT.
6. BY can control the REV inputs of both the FFY and FFX storage elements. See Storage Element Section.
7. Finally, the DIG_MUX multiplexer can switch BY onto to the DIG line, which exits the slice.

Other slice signals shown in [Figure 6, page 11](#) are discussed in the sections that follow.

Function Generator

Each of the two LUTs (F and G) in a slice have four logic inputs (A1-A4) and a single output (D). This permits any four-variable Boolean logic operation to be programmed into them. Furthermore, wide function multiplexers can be used to effectively combine LUTs within the same CLB or across different CLBs, making logic functions with still more input variables possible.

The LUTs in both the right-hand and left-hand slice-pairs not only support the logic functions described above, but also can function as ROM that is initialized with data at the time of configuration.

The LUTs in the left-hand slice-pair (even-numbered columns such as X0 in [Figure 5](#)) of each CLB support two additional functions that the right-hand slice-pair (odd-numbered columns such as X1) do not.

First, it is possible to program the "left-hand LUTs" as distributed RAM. This type of memory affords moderate amounts of data buffering anywhere along a data path. One left-hand LUT stores 16 bits. Multiple left-hand LUTs can be combined in various ways to store larger amounts of data. A dual port option combines two LUTs so that memory access is possible from two independent data lines. A Distributed ROM option permits pre-loading the memory with data during FPGA configuration.

Second, it is possible to program each left-hand LUT as a 16-bit shift register. Used in this way, each LUT can delay serial data anywhere from one to 16 clock cycles. The four left-hand LUTs of a single CLB can be combined to produce delays up to 64 clock cycles. The SHIFTIN and SHIFTOUT lines cascade LUTs to form larger shift registers. It is also possible to combine shift registers across more than one CLB. The resulting programmable delays can be used to balance the timing of data pipelines.

Block RAM Overview

All Spartan-3 devices support block RAM, which is organized as configurable, synchronous 18Kbit blocks. Block RAM stores relatively large amounts of data more efficiently than the distributed RAM feature described earlier. (The latter is better suited for buffering small amounts of data anywhere along signal paths.) This section describes basic Block RAM functions. For more information, see [XAPP463: Using Block RAM in Spartan-3 FPGAs](#).

The aspect ratio — i.e., width vs. depth — of each block RAM is configurable. Furthermore, multiple blocks can be cascaded to create still wider and/or deeper memories.

A choice among primitives determines whether the block RAM functions as dual- or single-port memory. A name of the form RAM16_S[w_A][w_B] calls out the dual-port primitive, where the integers w_A and w_B specify the total data path width at ports w_A and w_B, respectively. Thus, a RAM16_S9_S18 is a dual-port RAM with a 9-bit-wide Port A and an 18-bit-wide Port B. A name of the form RAM16_S[w] identifies the single-port primitive, where the integer w specifies the total data path width of the lone port. A RAM16_S18 is a single-port RAM with an 18-bit-wide port. Other memory functions — e.g., FIFOs, data path width conversion, ROM, etc. — are readily available using the CORE Generator™ system, part of the Xilinx development software.

Arrangement of RAM Blocks on Die

The XC3S50 has one column of block RAM. The Spartan-3 devices ranging from the XC3S200 to XC3S2000 have two columns of block RAM. The XC3S4000 and XC3S5000 have four columns. The position of the columns on the die is shown in Figure 1 in Module 1: **Introduction and Ordering Information**. For a given device, the total available RAM blocks are distributed equally among the columns. Table 8 shows the number of RAM blocks, the data storage capacity, and the number of columns for each device.

Table 8: Number of RAM Blocks by Device

Device	Total Number of RAM Blocks	Total Addressable Locations (bits)	Number of Columns
XC3S50	4	73,728	1
XC3S200	12	221,184	2
XC3S400	16	294,912	2
XC3S1000	24	442,368	2
XC3S1500	32	589,824	2
XC3S2000	40	737,280	2
XC3S4000	96	1,769,472	4
XC3S5000	104	1,916,928	4

Block RAM and multipliers have interconnects between them that permit simultaneous operation; however, since the multiplier shares inputs with the upper data bits of block RAM, the maximum data path width of the block RAM is 18 bits in this case.

The Internal Structure of the Block RAM

The block RAM has a dual port structure. The two identical data ports called A and B permit independent access to the common RAM block, which has a maximum capacity of 18,432 bits — or 16,384 bits when no parity lines are used. Each port has its own dedicated set of data, control and clock lines for synchronous read and write operations. There are four basic data paths, as shown in Figure 7: (1) write to and read from Port A, (2) write to and read from Port B, (3) data transfer from Port A to Port B, and (4) data transfer from Port B to Port A.

DS099-2_12_030703

Figure 7: Block RAM Data Paths

Block RAM Port Signal Definitions

Representations of the dual-port primitive RAM16_S[w_A][w_B] and the single-port primitive RAM16_S[w] with their associated signals are shown in Figure 8a and Figure 8b, respectively. These signals are defined in Table 9.

DS099-2_13_082104

Notes:

1. w_A and w_B are integers representing the total data path width (i.e., data bits plus parity bits) at ports A and B, respectively.
2. p_A and p_B are integers that indicate the number of data path lines serving as parity bits.
3. r_A and r_B are integers representing the address bus width at ports A and B, respectively.
4. The control signals CLK, WE, EN, and SSR on both ports have the option of inverted polarity.

Figure 8: Block RAM Primitives

Table 9: Block RAM Port Signals

Signal Description	Port A Signal Name	Port B Signal Name	Direction	Function
Address Bus	ADDRA	ADDRB	Input	The Address Bus selects a memory location for read or write operations. The width (w) of the port's associated data path determines the number of available address lines (r).
Data Input Bus	DIA	DIB	Input	Data at the DI input bus is written to the addressed memory location addressed on an enabled active CLK edge. It is possible to configure a port's total data path width (w) to be 1, 2, 4, 9, 18, or 36 bits. This selection applies to both the DI and DO paths of a given port. Each port is independent. For a port assigned a width (w), the number of addressable locations will be $16,384/(w-p)$ where "p" is the number of parity bits. Each memory location will have a width of "w" (including parity bits). See the DIP signal description for more information of parity.
Parity Data Input(s)	DIPA	DIPB	Input	Parity inputs represent additional bits included in the data input path to support error detection. The number of parity bits "p" included in the DI (same as for the DO bus) depends on a port's total data path width (w). See Table 10.

Table 9: Block RAM Port Signals (Continued)

Signal Description	Port A Signal Name	Port B Signal Name	Direction	Function
Data Output Bus	DOA	DOB	Output	Basic data access occurs whenever WE is inactive. The DO outputs mirror the data stored in the addressed memory location. Data access with WE asserted is also possible if one of the following two attributes is chosen: WRITE_FIRST accesses data before the write takes place. READ_FIRST accesses data after the write occurs. A third attribute, NO_CHANGE, latches the DO outputs upon the assertion of WE. It is possible to configure a port's total data path width (w) to be 1, 2, 4, 9, 18, or 36 bits. This selection applies to both the DI and DO paths. See the DI signal description.
Parity Data Output(s)	DOPA	DOPB	Output	Parity inputs represent additional bits included in the data input path to support error detection. The number of parity bits "p" included in the DI (same as for the DO bus) depends on a port's total data path width (w). See Table 10.
Write Enable	WEA	WEB	Input	When asserted together with EN, this input enables the writing of data to the RAM. In this case, the data access attributes WRITE_FIRST, READ_FIRST or NO_CHANGE determines if and how data is updated on the DO outputs. See the DO signal description. When WE is inactive with EN asserted, read operations are still possible. In this case, a transparent latch passes data from the addressed memory location to the DO outputs.
Clock Enable	ENA	ENB	Input	When asserted, this input enables the CLK signal to synchronize Block RAM functions as follows: the writing of data to the DI inputs (when WE is also asserted), the updating of data at the DO outputs as well as the setting/resetting of the DO output latches. When de-asserted, the above functions are disabled.
Set/Reset	SSRA	SSRB	Input	When asserted, this pin forces the DO output latch to the value that the SRVAL attribute is set to. A Set/Reset operation on one port has no effect on the other ports functioning, nor does it disturb the memory's data contents. It is synchronized to the CLK signal.
Clock	CLKA	CLKB	Input	This input accepts the clock signal to which read and write operations are synchronized. All associated port inputs are required to meet setup times with respect to the clock signal's active edge. The data output bus responds after a clock-to-out delay referenced to the clock signal's active edge.

Port Aspect Ratios

On a given port, it is possible to select a number of different possible widths (w – p) for the DI/DO buses as shown in [Table 10](#). These two buses always have the same width. This data bus width selection is independent for each port. If the data bus width of Port A differs from that of Port B, the

Block RAM automatically performs a bus-matching function. When data are written to a port with a narrow bus, then read from a port with a wide bus, the latter port will effectively combine “narrow” words to form “wide” words. Similarly, when data are written into a port with a wide bus, then read from a port with a narrow bus, the latter port will divide

“wide” words to form “narrow” words. When the data bus width is eight bits or greater, extra parity bits become available. The width of the total data path (w) is the sum of the DI/DO bus width and any parity bits (p).

The width selection made for the DI/DO bus determines the number of address lines according to the relationship expressed below:

$$r = 14 - [\log(w-p)/\log(2)] \quad (1)$$

In turn, the number of address lines delimits the total number (n) of addressable locations or depth according to the following equation:

$$n = 2^r \quad (2)$$

The product of w and n yields the total block RAM capacity. Equations (1) and (2) show that as the data bus width increases, the number of address lines along with the number of addressable memory locations decreases. Using the permissible DI/DO bus widths as inputs to these equations provides the bus width and memory capacity measures shown in Table 10.

Table 10: Port Aspect Ratios for Port A or B

DI/DO Bus Width (w – p bits)	DIP/DOP Bus Width (p bits)	Total Data Path Width (w bits)	ADDR Bus Width (r bits)	No. of Addressable Locations (n)	Block RAM Capacity (bits)
1	0	1	14	16,384	16,384
2	0	2	13	8,192	16,384
4	0	4	12	4,096	16,384
8	1	9	11	2,048	18,432
16	2	18	10	1,024	18,432
32	4	36	9	512	18,432

Block RAM Data Operations

Writing data to and accessing data from the block RAM are synchronous operations that take place independently on each of the two ports.

The waveforms for the write operation are shown in the top half of the Figure 9, Figure 10, and Figure 11. When the WE and EN signals enable the active edge of CLK, data at the DI input bus is written to the block RAM location addressed by the ADDR lines.

There are a number of different conditions under which data can be accessed at the DO outputs. Basic data access always occurs when the WE input is inactive. Under this

condition, data stored in the memory location addressed by the ADDR lines passes through a transparent output latch to the DO outputs. The timing for basic data access is shown in the portions of Figure 9, Figure 10, and Figure 11 during which WE is Low.

Data can also be accessed on the DO outputs when asserting the WE input. This is accomplished using two different attributes:

Choosing the WRITE_FIRST attribute, data is written to the addressed memory location on an enabled active CLK edge and is also passed to the DO outputs. WRITE_FIRST timing is shown in the portion of Figure 9 during which WE is High.

Figure 9: Waveforms of Block RAM Data Operations with WRITE_FIRST Selected

Choosing the READ_FIRST attribute, data already stored in the addressed location pass to the DO outputs before that location is over-written with new data from the DI inputs on

an enabled active CLK edge. READ_FIRST timing is shown in the portion of Figure 10 during which WE is High.

Figure 10: Waveforms of Block RAM Data Operations with READ_FIRST Selected

Choosing a third attribute called NO_CHANGE puts the DO outputs in a latched state when asserting WE. Under this condition, the DO outputs will retain the data driven just

before WE was asserted. NO_CHANGE timing is shown in the portion of Figure 11 during which WE is High.

Figure 11: Waveforms of Block RAM Data Operations with NO_CHANGE Selected

Dedicated Multipliers

All Spartan-3 devices provide embedded multipliers that accept two 18-bit words as inputs to produce a 36-bit product. This section provides an introduction to multipliers. For further details, see [XAPP467: Using Embedded Multipliers in Spartan-3 FPGAs](#).

The input buses to the multiplier accept data in two’s-complement form (either 18-bit signed or 17-bit unsigned). One such multiplier is matched to each block RAM on the die. The close physical proximity of the two ensures efficient

data handling. Cascading multipliers permits multiplicands more than three in number as well as wider than 18-bits. The multiplier is placed in a design using one of two primitives: an asynchronous version called MULT18X18 and a version with a register at the outputs called MULT18X18S, as shown in [Figure 12a](#) and [Figure 12b](#), respectively. The signals for these primitives are defined in [Table 11](#).

The CORE Generator system produces multipliers based on these primitives that can be configured to suit a wide range of requirements.

Figure 12: Embedded Multiplier Primitives

Table 11: Embedded Multiplier Primitives Descriptions

Signal Name	Direction	Function
A[17:0]	Input	Apply one 18-bit multiplicand to these inputs. The MULT18X18S primitive requires a setup time before the enabled rising edge of CLK.
B[17:0]	Input	Apply the other 18-bit multiplicand to these inputs. The MULT18X18S primitive requires a setup time before the enabled rising edge of CLK.
P[35:0]	Output	The output on the P bus is a 36-bit product of the multiplicands A and B. In the case of the MULT18X18S primitive, an enabled rising CLK edge updates the P bus.
CLK	Input	CLK is only an input to the MULT18X18S primitive. The clock signal applied to this input when enabled by CE, updates the output register that drives the P bus.
CE	Input	CE is only an input to the MULT18X18S primitive. Enable for the CLK signal. Asserting this input enables the CLK signal to update the P bus.
RST	Input	RST is only an input to the MULT18X18S primitive. Asserting this input resets the output register on an enabled, rising CLK edge, forcing the P bus to all zeroes.

Notes:

1. The control signals CLK, CE and RST have the option of inverted polarity.

Digital Clock Manager (DCM)

Spartan-3 devices provide flexible, complete control over clock frequency, phase shift and skew through the use of the DCM feature. To accomplish this, the DCM employs a Delay-Locked Loop (DLL), a fully digital control system that uses feedback to maintain clock signal characteristics with a high degree of precision despite normal variations in operating temperature and voltage. This section provides a fundamental description of the DCM. For further information, see [XAPP462: Using Digital Clock Managers \(DCMs\) in Spartan-3 FPGAs](#).

Each member of the Spartan-3 family has four DCMs, except the smallest, the XC3S50, which has two DCMs. The DCMs are located at the ends of the outermost Block RAM column(s). See [Figure 1](#) in Module 1: **Introduction and Ordering Information**. The Digital Clock Manager is placed in a design as the “DCM” primitive.

The DCM supports three major functions:

- **Clock-skew Elimination:** Clock skew describes the extent to which clock signals may, under normal circumstances, deviate from zero-phase alignment. It occurs when slight differences in path delays cause the

clock signal to arrive at different points on the die at different times. This clock skew can increase set-up and hold time requirements as well as clock-to-out time, which may be undesirable in applications operating at a high frequency, when timing is critical. The DCM eliminates clock skew by aligning the output clock signal it generates with another version of the clock signal that is fed back. As a result, the two clock signals establish a zero-phase relationship. This effectively cancels out clock distribution delays that may lie in the signal path leading from the clock output of the DCM to its feedback input.

- **Frequency Synthesis:** Provided with an input clock signal, the DCM can generate a wide range of different output clock frequencies. This is accomplished by either multiplying and/or dividing the frequency of the input clock signal by any of several different factors.
- **Phase Shifting:** The DCM provides the ability to shift the phase of all its output clock signals with respect to its input clock signal.

Figure 13: DCM Functional Blocks and Associated Signals

The DCM has four functional components: the Delay-Locked Loop (DLL), the Digital Frequency Synthesizer (DFS), the Phase Shifter (PS), and the Status Logic.

Each component has its associated signals, as shown in Figure 13.

Delay-Locked Loop (DLL)

The most basic function of the DLL component is to eliminate clock skew. The main signal path of the DLL consists of an input stage, followed by a series of discrete delay elements or *taps*, which in turn leads to an output stage. This

path together with logic for phase detection and control forms a system complete with feedback as shown in Figure 14.

Figure 14: Simplified Functional Diagram of DLL

The DLL component has two clock inputs, CLKIN and CLKFB, as well as seven clock outputs, CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV as described in [Table 12](#). The clock outputs drive simultaneously; however, the High Frequency mode only supports

a subset of the outputs available in the Low Frequency mode. See [DLL Frequency Modes, page 23](#). Signals that initialize and report the state of the DLL are discussed in [The Status Logic Component, page 28](#).

Table 12: DLL Signals

Signal	Direction	Description	Mode Support	
			Low Frequency	High Frequency
CLKIN	Input	Accepts original clock signal.	Yes	Yes
CLKFB	Input	Accepts either CLK0 or CLK2X as feed back signal. (Set CLK_FEEDBACK attribute accordingly).	Yes	Yes
CLK0	Output	Generates clock signal with same frequency and phase as CLKIN.	Yes	Yes
CLK90	Output	Generates clock signal with same frequency as CLKIN, only phase-shifted 90°.	Yes	No
CLK180	Output	Generates clock signal with same frequency as CLKIN, only phase-shifted 180°.	Yes	Yes
CLK270	Output	Generates clock signal with same frequency as CLKIN, only phase-shifted 270°.	Yes	No
CLK2X	Output	Generates clock signal with same phase as CLKIN, only twice the frequency.	Yes	No
CLK2X180	Output	Generates clock signal with twice the frequency of CLKIN, phase-shifted 180° with respect to CLKIN.	Yes	No
CLKDV	Output	Divides the CLKIN frequency by CLKDV_DIVIDE value to generate lower frequency clock signal that is phase-aligned to CLKIN.	Yes	Yes

The clock signal supplied to the CLKIN input serves as a reference waveform, with which the DLL seeks to align the feedback signal at the CLKFB input. When eliminating clock skew, the common approach to using the DLL is as follows: The CLK0 signal is passed through the clock distribution network to all the registers it synchronizes. These registers are either internal or external to the FPGA. After passing through the clock distribution network, the clock signal returns to the DLL via a feedback line called CLKFB. The control block inside the DLL measures the phase error between CLKFB and CLKIN. This phase error is a measure of the clock skew that the clock distribution network intro-

duces. The control block activates the appropriate number of delay elements to cancel out the clock skew. Once the DLL has brought the CLK0 signal in phase with the CLKIN signal, it asserts the LOCKED output, indicating a “lock” on to the CLKIN signal.

DLL Attributes and Related Functions

A number of different functional options can be set for the DLL component through the use of the attributes described in [Table 13](#). Each attribute is described in detail in the sections that follow:

Table 13: DLL Attributes

Attribute	Description	Values
CLK_FEEDBACK	Chooses either the CLK0 or CLK2X output to drive the CLKFB input	NONE, 1X, 2X
DLL_FREQUENCY_MODE	Chooses between High Frequency and Low Frequency modes	LOW, HIGH
CLKIN_DIVIDE_BY_2	Halves the frequency of the CLKIN signal just as it enters the DCM	TRUE, FALSE
CLKDV_DIVIDE	Selects constant used to divide the CLKIN input frequency to generate the CLKDV output frequency	1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, 6.0, 6.5, 7.0, 7.5, 8, 9, 10, 11, 12, 13, 14, 15, and 16.
DUTY_CYCLE_CORRECTION	Enables 50% duty cycle correction for the CLK0, CLK90, CLK180, and CLK270 outputs	TRUE, FALSE

DLL Clock Input Connections

An external clock source enters the FPGA using a Global Clock Input Buffer (IBUFG), which directly accesses the global clock network or an Input Buffer (IBUF). Clock signals within the FPGA drive a global clock net using a Global Clock Multiplexer Buffer (BUFGMUX). The global clock net connects directly to the CLKIN input. The internal and external connections are shown in [Figure 15a](#) and [Figure 15c](#), respectively. A differential clock (e.g., LVDS) can serve as an input to CLKIN.

DLL Clock Output and Feedback Connections

As many as four of the nine DCM clock outputs can simultaneously drive the four BUFGMUX buffers on the same die edge (top or bottom). All DCM clock outputs can simultaneously drive general routing resources, including interconnect leading to OBUF buffers.

The feedback loop is essential for DLL operation and is established by driving the CLKFB input with either the CLK0 or the CLK2X signal so that any undesirable clock distribution delay is included in the loop. It is possible to use either of these two signals for synchronizing any of the seven DLL outputs: CLK0, CLK90, CLK180, CLK270, CLKDV, CLK2X, or CLK2X180. The value assigned to the CLK_FEEDBACK attribute must agree with the physical feedback connection: a value of 1X for the CLK0 case, 2X for the CLK2X case. If the DCM is used in an application that does not require the DLL — i.e., only the DFS is used — then there is no feedback loop so CLK_FEEDBACK is set to NONE.

There are two basic cases that determine how to connect the DLL clock outputs and feedback connections: on-chip synchronization and off-chip synchronization, which are illustrated in [Figure 15a](#) through [Figure 15d](#).

DS099-2_09_082104

Notes:

1. In the Low Frequency mode, all seven DLL outputs are available. In the High Frequency mode, only the CLK0, CLK180, and CLKDV outputs are available.

Figure 15: Input Clock, Output Clock, and Feedback Connections for the DLL

In the on-chip synchronization case (Figure 15a and Figure 15b), it is possible to connect any of the DLL's seven output clock signals through general routing resources to the FPGA's internal registers. Either a Global Clock Buffer (BUFG) or a BUFGMUX affords access to the global clock network. As shown in Figure 15a, the feedback loop is created by routing CLK0 (or CLK2X, in Figure 15b) to a global clock net, which in turn drives the CLKFB input.

In the off-chip synchronization case (Figure 15c and Figure 15d), CLK0 (or CLK2X) plus any of the DLL's other output clock signals exit the FPGA using output buffers (OBUF) to drive an external clock network plus registers on the board. As shown in Figure 15c, the feedback loop is formed by feeding CLK0 (or CLK2X, in Figure 15d) back into the FPGA using an IBUFG, which directly accesses the global clock network, or an IBUF. Then, the global clock net is connected directly to the CLKFB input.

DLL Frequency Modes

The DLL supports two distinct operating modes, High Frequency and Low Frequency, with each specified over a different clock frequency range. The DLL_FREQUENCY_MODE

attribute chooses between the two modes. When the attribute is set to LOW, the Low Frequency mode permits all seven DLL clock outputs to operate over a low-to-moderate frequency range. When the attribute is set to HIGH, the High Frequency mode allows the CLK0, CLK180 and CLKDV outputs to operate at the highest possible frequencies. The remaining DLL clock outputs are not available for use in High Frequency mode.

Accommodating High Input Frequencies

If the frequency of the CLKIN signal is high such that it exceeds the maximum permitted, divide it down to an acceptable value using the CLKIN_DIVIDE_BY_2 attribute. When this attribute is set to TRUE, the CLKIN frequency is divided by a factor of two just as it enters the DCM.

Coarse Phase Shift Outputs of the DLL Component

In addition to CLK0 for zero-phase alignment to the CLKIN signal, the DLL also provides the CLK90, CLK180 and CLK270 outputs for 90°, 180° and 270° phase-shifted signals, respectively. These signals are described in Table 12.

Their relative timing in the Low Frequency Mode is shown in **Figure 16**. The CLK90, CLK180 and CLK270 outputs are not available when operating in the High Frequency mode. (See the description of the DLL_FREQUENCY_MODE attribute in **Table 13**.) For control in finer increments than 90°, see the **Phase Shifter (PS)**, **page 26** section.

Basic Frequency Synthesis Outputs of the DLL Component

The DLL component provides basic options for frequency multiplication and division in addition to the more flexible synthesis capability of the DFS component, described in a later section. These operations result in output clock signals with frequencies that are either a fraction (for division) or a multiple (for multiplication) of the incoming clock frequency. The CLK2X output produces an in-phase signal that is twice the frequency of CLKIN. The CLK2X180 output also doubles the frequency, but is 180° out-of-phase with respect to CLKIN. The CLKDIV output generates a clock frequency that is a predetermined fraction of the CLKIN frequency. The CLKDV_DIVIDE attribute determines the factor used to divide the CLKIN frequency. The attribute can be set to various values as described in **Table 13**. The basic frequency synthesis outputs are described in **Table 12**. Their relative timing in the Low Frequency Mode is shown in **Figure 16**.

The CLK2X and CLK2X180 outputs are not available when operating in the High Frequency mode. (See the description of the DLL_FREQUENCY_MODE attribute in **Table 14**.)

Duty Cycle Correction of DLL Clock Outputs

The CLK2X⁽¹⁾, CLK2X180, and CLKDV⁽²⁾ output signals ordinarily exhibit a 50% duty cycle – even if the incoming CLKIN signal has a different duty cycle. Fifty-percent duty cycle means that the High and Low times of each clock cycle are equal. The DUTY_CYCLE_CORRECTION attribute determines whether or not duty cycle correction is applied to the CLK0, CLK90, CLK180 and CLK270 outputs. If DUTY_CYCLE_CORRECTION is set to TRUE, then the duty cycle of these four outputs is corrected to 50%. If DUTY_CYCLE_CORRECTION is set to FALSE, then these outputs exhibit the same duty cycle as the CLKIN signal. **Figure 16** compares the characteristics of the DLL's output signals to those of the CLKIN signal.

Phase: 0° 90° 180° 270° 0° 90° 180° 270° 0°

Input Signal (30% Duty Cycle)

Output Signal - Duty Cycle is Always Corrected

Output Signal - Attribute Corrects Duty Cycle

DUTY_CYCLE_CORRECTION = FALSE

DUTY_CYCLE_CORRECTION = TRUE

DS099-2_10_031303

Notes:

1. The DLL attribute CLKDV_DIVIDE is set to 2.

Figure 16: Characteristics of the DLL Clock Outputs

1. The CLK2X output generates a 25% duty cycle clock at the same frequency as the CLKIN signal until the DLL has achieved lock.
2. The duty cycle of the CLKDV outputs may differ somewhat from 50% (i.e., the signal will be High for less than 50% of the period) when the CLKDV_DIVIDE attribute is set to a non-integer value and the DLL is operating in the High Frequency mode.

Digital Frequency Synthesizer (DFS)

The DFS component generates clock signals the frequency of which is a product of the clock frequency at the CLKIN input and a ratio of two user-determined integers. Because of the wide range of possible output frequencies such a ratio permits, the DFS feature provides still further flexibility than the DLL's basic synthesis options as described in the preceding section. The DFS component's two dedicated outputs, CLKFX and CLKFX180, are defined in Table 15.

The signal at the CLKFX180 output is essentially an inversion of the CLKFX signal. These two outputs always exhibit a 50% duty cycle. This is true even when the CLKIN signal does not. These DFS clock outputs are driven at the same time as the DLL's seven clock outputs.

The numerator of the ratio is the integer value assigned to the attribute CLKFX_MULTIPLY and the denominator is the integer value assigned to the attribute CLKFX_DIVIDE. These attributes are described in Table 14.

The output frequency (f_{CLKFX}) can be expressed as a function of the incoming clock frequency (f_{CLKIN}) as follows:

$$f_{CLKFX} = f_{CLKIN} * (CLKFX_MULTIPLY / CLKFX_DIVIDE) \quad (3)$$

Regarding the two attributes, it is possible to assign any combination of integer values, provided that two conditions are met:

1. The two values fall within their corresponding ranges, as specified in Table 14.
2. The f_{CLKFX} frequency calculated from the above expression accords with the DCM's operating frequency specifications.

For example, if CLKFX_MULTIPLY = 5 and CLKFX_DIVIDE = 3, then the frequency of the output clock signal would be 5/3 that of the input clock signal.

DFS Frequency Modes

The DFS supports two operating modes, High Frequency and Low Frequency, with each specified over a different clock frequency range. The DFS_FREQUENCY_MODE attribute chooses between the two modes. When the attribute is set to LOW, the Low Frequency mode permits

the two DFS outputs to operate over a low-to-moderate frequency range. When the attribute is set to HIGH, the High Frequency mode allows both these outputs to operate at the highest possible frequencies.

DFS With or Without the DLL

The DFS component can be used with or without the DLL component:

Without the DLL, the DFS component multiplies or divides the CLKIN signal frequency according to the respective CLKFX_MULTIPLY and CLKFX_DIVIDE values, generating a clock with the new target frequency on the CLKFX and CLKFX180 outputs. Though classified as belonging to the DLL component, the CLKIN input is shared with the DFS component. This case does not employ feedback loop; therefore, it cannot correct for clock distribution delay.

With the DLL, the DFS operates as described in the preceding case, only with the additional benefit of eliminating the clock distribution delay. In this case, a feedback loop from the CLK0 output to the CLKFB input must be present.

The DLL and DFS components work together to achieve this phase correction as follows: Given values for the CLKFX_MULTIPLY and CLKFX_DIVIDE attributes, the DLL selects the delay element for which the output clock edge coincides with the input clock edge whenever mathematically possible. For example, when CLKFX_MULTIPLY = 5 and CLKFX_DIVIDE = 3, the input and output clock edges will coincide every three input periods, which is equivalent in time to five output periods.

Smaller CLKFX_MULTIPLY and CLKFX_DIVIDE values achieve faster lock times. With no factors common to the two attributes, alignment will occur once with every number of cycles equal to the CLKFX_DIVIDE value. Therefore, it is recommended that the user reduce these values by factoring wherever possible. For example, given CLKFX_MULTIPLY = 9 and CLKFX_DIVIDE = 6, removing a factor of three yields CLKFX_MULTIPLY = 3 and CLKFX_DIVIDE = 2. While both value-pairs will result in the multiplication of clock frequency by 3/2, the latter value-pair will enable the DLL to lock more quickly.

Table 14: DFS Attributes

Attribute	Description	Values
DFS_FREQUENCY_MODE	Chooses between High Frequency and Low Frequency modes	Low, High
CLKFX_MULTIPLY	Frequency multiplier constant	Integer from 2 to 32
CLKFX_DIVIDE	Frequency divisor constant	Integer from 1 to 32

Table 15: DFS Signals

Signal	Direction	Description
CLKFX	Output	Multiplies the CLKIN frequency by the attribute-value ratio (CLKFX_MULTIPLY/CLKFX_DIVIDE) to generate a clock signal with a new target frequency.
CLKFX180	Output	Generates a clock signal with same frequency as CLKFX, only shifted 180° out-of-phase.

DFS Clock Output Connections

There are two basic cases that determine how to connect the DFS clock outputs: on-chip and off-chip, which are illustrated in [Figure 15a](#) and [Figure 15c](#), respectively. This is similar to what has already been described for the DLL component. See the [DLL Clock Output and Feedback Connections](#), page 22 section.

In the on-chip case, it is possible to connect either of the DFS's two output clock signals through general routing resources to the FPGA's internal registers. Either a Global Clock Buffer (BUFG) or a BUFGMUX affords access to the global clock network. The optional feedback loop is formed in this way, routing CLK0 to a global clock net, which in turn drives the CLKFB input.

In the off-chip case, the DFS's two output clock signals, plus CLK0 for an optional feedback loop, can exit the FPGA using output buffers (OBUF) to drive a clock network plus registers on the board. The feedback loop is formed by feeding the CLK0 signal back into the FPGA using an IBUFG, which directly accesses the global clock network, or an IBUF. Then, the global clock net is connected directly to the CLKFB input.

Phase Shifter (PS)

The DCM provides two approaches to controlling the phase of a DCM clock output signal relative to the CLKIN signal: First, there are nine clock outputs that employ the DLL to achieve a desired phase relationship: CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, CLKDV CLKFX, and CLKFX180. These outputs afford "coarse" phase control.

The second approach uses the PS component described in this section to provide a still finer degree of control. The PS component accomplishes this by introducing a "fine phase shift" (T_{PS}) between the CLKFB and CLKIN signals inside the DLL component. The user can control this fine phase shift down to a resolution of 1/256 of a CLKIN cycle or one tap delay (DCM_TAP), whichever is greater. When in use, the PS component shifts the phase of all nine DCM clock output signals together. If the PS component is used together with a DCM clock output such as the CLK90, CLK180, CLK270, CLK2X180 and CLKFX180, then the fine phase shift of the former gets added to the coarse phase shift of the latter.

Table 16: PS Attributes

Attribute	Description	Values
CLKOUT_PHASE_SHIFT	Disables PS component or chooses between Fixed Phase and Variable Phase modes.	NONE, FIXED, VARIABLE
PHASE_SHIFT	Determines size and direction of initial fine phase shift.	Integers from -255 to +255 ⁽¹⁾

Notes:

1. The practical range of values will be less when $T_{CLKIN} > FINE_SHIFT_RANGE$ in the Fixed Phase mode, also when $T_{CLKIN} > (FINE_SHIFT_RANGE)/2$ in the Variable Phase mode. the FINE_SHIFT_RANGE represents the sum total delay of all taps.

PS Component Enabling and Mode Selection

The CLKOUT_PHASE_SHIFT attribute enables the PS component for use in addition to selecting between two operating modes. As described in [Table 16](#), this attribute has three possible values: NONE, FIXED and VARIABLE. When CLKOUT_PHASE_SHIFT is set to NONE, the PS component is disabled and its inputs, PSEN, PSCLK, and PSINCDEC, must be tied to GND. The set of waveforms in [Figure 17a](#) shows the disabled case, where the DLL maintains a zero-phase alignment of signals CLKFB and CLKIN upon which the PS component has no effect. The PS component is enabled by setting the attribute to either the FIXED or VARIABLE values, which select the Fixed Phase mode and the Variable Phase mode, respectively. These two modes are described in the sections that follow

Determining the Fine Phase Shift

The user controls the phase shift of CLKFB relative to CLKIN by setting and/or adjusting the value of the PHASE_SHIFT attribute. This value must be an integer ranging from -255 to +255. The PS component uses this value to calculate the desired fine phase shift (T_{PS}) as a fraction of the CLKIN period (T_{CLKIN}). Given values for PHASE_SHIFT and T_{CLKIN} , it is possible to calculate T_{PS} as follows:

$$T_{PS} = (\text{PHASE_SHIFT}/256) * T_{CLKIN} \quad (4)$$

Both the Fixed Phase and Variable Phase operating modes employ this calculation. If the PHASE_SHIFT value is zero, then CLKFB and CLKIN will be in phase, the same as when the PS component is disabled. When the PHASE_SHIFT value is positive, the CLKFB signal will be shifted later in time with respect to CLKIN. If the attribute value is negative, the CLKFB signal will be shifted earlier in time with respect to CLKIN.

The Fixed Phase Mode

This mode fixes the desired fine phase shift to a fraction of the T_{CLKIN} , as determined by Equation (4) and its user-selected PHASE_SHIFT value P. The set of waveforms in [Figure 17b](#) illustrates the relationship between CLKFB and CLKIN in the Fixed Phase mode. In the Fixed Phase mode, the PSEN, PSCLK and PSINCDEC inputs are not used and must be tied to GND.

a. CLKOUT_PHASE_SHIFT = NONE

b. CLKOUT_PHASE_SHIFT = FIXED

c. CLKOUT_PHASE_SHIFT = VARIABLE

DS099-2_11_031303

Notes:

1. P represents the integer value ranging from -255 to +255 to which the PHASE_SHIFT attribute is assigned.
2. N is an integer value ranging from -255 to +255 that represents the net phase shift effect from a series of increment and/or decrement operations.

$$N = \{\text{Total number of increments}\} - \{\text{Total number of decrements}\}$$

A positive value for N indicates a net increment; a negative value indicates a net decrement.

Figure 17: Phase Shifter Waveforms

Table 17: Signals for Variable Phase Mode

Signal	Direction	Description
PSEN ⁽¹⁾	Input	Enables PSCLK for variable phase adjustment.
PSCLK ⁽¹⁾	Input	Clock to synchronize phase shift adjustment.
PSINCDEC ⁽¹⁾	Input	Chooses between increment and decrement for phase adjustment. It is synchronized to the PSCLK signal.
PSDONE	Output	Goes High to indicate that present phase adjustment is complete and PS component is ready for next phase adjustment request. It is synchronized to the PSCLK signal.

Notes:

1. It is possible to program this input for either a true or inverted polarity

The Variable Phase Mode

The “Variable Phase” mode dynamically adjusts the fine phase shift over time using three inputs to the PS component, namely PSEN, PSCLK and PSINCDEC, as defined in [Table 17](#).

Just following device configuration, the PS component initially determines T_{PS} by evaluating Equation (4) for the value assigned to the PHASE_SHIFT attribute. Then to dynamically adjust that phase shift, use the three PS inputs to increase or decrease the fine phase shift.

PSINCDEC is synchronized to the PSCLK clock signal, which is enabled by asserting PSEN. It is possible to drive the PSCLK input with the CLKIN signal or any other clock signal. A request for phase adjustment is entered as follows: For each PSCLK cycle that PSINCDEC is High, the PS component adds 1/256 of a CLKIN cycle to T_{PS} . Similarly, for each enabled PSCLK cycle that PSINCDEC is Low, the PS component subtracts 1/256 of a CLKIN cycle from T_{PS} . The phase adjustment may require as many as 100 CLKIN cycles plus three PSCLK cycles to take effect, at which

point the output PSDONE goes High for one PSCLK cycle. This pulse indicates that the PS component has finished the present adjustment and is now ready for the next request. Asserting the Reset (RST) input, returns T_{PS} to its original shift time, as determined by the PHASE_SHIFT attribute value. The set of waveforms in [Figure 17c](#) illustrates the relationship between CLKFB and CLKIN in the Variable Phase mode.

The Status Logic Component

The Status Logic component not only reports on the state of the DCM but also provides a means of resetting the DCM to an initial known state. The signals associated with the Status Logic component are described in [Table 18](#).

As a rule, the Reset (RST) input is asserted only upon configuring the device or changing the CLKIN frequency. A DCM reset does not affect attribute values (e.g., CLKFX_MULTIPLY and CLKFX_DIVIDE). If not used, RST must be tied to GND.

The eight bits of the STATUS bus are defined in [Table 19](#).

Table 18: Status Logic Signals

Signal	Direction	Description
RST	Input	A High resets the entire DCM to its initial power-on state. Initializes the DLL taps for a delay of zero. Sets the LOCKED output Low. This input is asynchronous.
STATUS[7:0]	Output	The bit values on the STATUS bus provide information regarding the state of DLL and PS operation
LOCKED	Output	Indicates that the CLKIN and CLKFB signals are in phase by going High. The two signals are out-of-phase when Low.

Table 19: DCM STATUS Bus

Bit	Name	Description
0	Phase Shift Overflow	A value of 1 indicates a phase shift overflow when one of two conditions occur: - Incrementing (or decrementing) TPS beyond 255/256 of a CLKIN cycle. - The DLL is producing its maximum possible phase shift (i.e., all delay taps are active).⁽¹⁾
1	CLKIN Activity	A value of 1 indicates that the CLKIN signal is not toggling. A value of 0 indicates toggling. This bit functions only when the CLKFB input is connected. ⁽²⁾
2	Reserved	-
3	Reserved	-
4	Reserved	-
5	Reserved	-
6	Reserved	-
7	Reserved	-

Notes:

1. The DLL phase shift with all delay taps active is specified as the parameter FINE_SHIFT_RANGE.
2. If only the DFS clock outputs are used, but none of the DLL clock outputs, this bit will not go High when the CLKIN signal stops.

Table 20: Status Attributes

Attribute	Description	Values
STARTUP_WAIT	Delays transition from configuration to user mode until lock condition is achieved.	TRUE, FALSE

Stabilizing DCM Clocks Before User Mode

It is possible to delay the completion of device configuration until after the DLL has achieved a lock condition using the STARTUP_WAIT attribute described in [Table 20](#). This option ensures that the FPGA does not enter user mode — i.e., begin functional operation — until all system clocks generated by the DCM are stable. In order to achieve the delay, it is necessary to set the attribute to TRUE as well as set the BitGen option LCK_cycle to one of the six cycles making up the Startup phase of configuration. The selected cycle defines the point at which configuration will halt until the LOCKED output goes High.

Global Clock Network

Spartan-3 devices have eight Global Clock inputs called GCLK0 - GCLK7. These inputs provide access to a low-capacitance, low-skew network that is well-suited to carrying high-frequency signals. The Spartan-3 clock network is shown in [Figure 18](#). GCLK0 through GCLK3 are placed at the center of the die's bottom edge. GCLK4 through GCLK7 are placed at the center of the die's top edge. It is possible to route each of the eight Global Clock inputs to any CLB on the die.

Eight Global Clock Multiplexers (also called BUFGMUX elements) are provided that accept signals from Global Clock inputs and route them to the internal clock network as well

as DCMs. Four BUFGMUX elements are placed at the center of the die's bottom edge, just above the GCLK0 - GCLK4 inputs. The remaining four BUFGMUX elements are placed at the center of the die's top edge, just below the GCLK4 - GCLK7 inputs.

Each BUFGMUX element is a 2-to-1 multiplexer that can receive signals from any of the four following sources:

1. One of the four Global Clock inputs on the same side of the die — top or bottom — as the BUFGMUX element in use.
2. Any of four nearby horizontal Double lines.
3. Any of four outputs from the DCM in the right-hand quadrant that is on the same side of the die as the BUFGMUX element in use.
4. Any of four outputs from the DCM in the left-hand quadrant that is on the same side of the die as the BUFGMUX element in use.

Each BUFGMUX can switch incoming clock signals to two possible destinations:

1. The vertical spine belonging to the same side of the die — top or bottom — as the BUFGMUX element in use. The two spines — top and bottom — each comprise four vertical clock lines, each running from one of the BUFGMUX elements on the same side towards the center of the die. At the center of the die, clock signals reach the eight-line horizontal spine, which spans the

width of the die. In turn, the horizontal spine branches out into a subsidiary clock interconnect that accesses the CLBs.

2. The clock input of either DCM on the same side of the die — top or bottom — as the BUFGMUX element in use.

A Global clock input is placed in a design using either a BUFGMUX element or the BUFG (Global Clock Buffer) element. For the purpose of minimizing the dynamic power dissipation of the clock network, the Xilinx development software automatically disables all clock line segments that a design does not use.

Figure 18: Spartan-3 Clock Network (Top View)

DS099-2_18_070203

Interconnect

Interconnect (or routing) passes signals among the various functional elements of Spartan-3 devices. There are four kinds of interconnect: Long lines, Hex lines, Double lines, and Direct lines.

Long lines connect to one out of every six CLBs (see Figure 19a). Because of their low capacitance, these lines are well-suited for carrying high-frequency signals with minimal loading effects (e.g. skew). If all eight Global Clock Inputs are already committed and there remain additional clock signals to be assigned, Long lines serve as a good alternative.

Hex lines connect one out of every three CLBs (see Figure 19b). These lines fall between Long lines and Dou-

ble lines in terms of capability: Hex lines approach the high-frequency characteristics of Long lines at the same time, offering greater connectivity.

Double lines connect to every other CLB (see Figure 19c). Compared to the types of lines already discussed, Double lines provide a higher degree of flexibility when making connections.

Direct lines afford any CLB direct access to neighboring CLBs (see Figure 19d). These lines are most often used to conduct a signal from a "source" CLB to a Double, Hex, or Long line and then from the longer interconnect back to a Direct line accessing a "destination" CLB.

Figure 19: Types of Interconnect

Configuration

Spartan-3 devices are configured by loading application specific configuration data into the internal configuration memory. Configuration is carried out using a subset of the device pins, some of which are "Dedicated" to one function only, while others, indicated by the term "Dual-Purpose",

can be re-used as general-purpose User I/Os once configuration is complete.

Depending on the system design, several configuration modes are supported, selectable via mode pins. The mode pins M0, M1, and M2 are Dedicated pins. The mode pin settings are shown in [Table 21](#).

Table 21: Spartan-3 Configuration Mode Pin Settings

Configuration Mode ⁽¹⁾	M0	M1	M2	Synchronizing Clock	Data Width	Serial DOUT ⁽²⁾
Master Serial	0	0	0	CCLK Output	1	Yes
Slave Serial	1	1	1	CCLK Input	1	Yes
Master Parallel	1	1	0	CCLK Output	8	No
Slave Parallel	0	1	1	CCLK Input	8	No
JTAG	1	0	1	TCK Input	1	No

Notes:

1. The voltage levels on the M0, M1, and M2 pins select the configuration mode.
2. The daisy chain is possible only in the Serial modes when DOUT is used.

An additional pin, HSWAP_EN, is used in conjunction with the mode pins to select whether user I/O pins have pull-ups during configuration. By default, HSWAP_EN is tied High (internal pull-up) which shuts off the pull-ups on the user I/O pins during configuration. When HSWAP_EN is tied Low, user I/Os have pull-ups during configuration. Other Dedicated pins are CCLK (the configuration clock pin), DONE, PROG_B, and the boundary-scan pins: TDI, TDO, TMS, and TCK. Depending on the configuration mode chosen, CCLK can be an output generated by the FPGA, or an input accepting an externally generated clock.

A persist option is available which can be used to force the configuration pins to retain their configuration function even after device configuration is complete. If the persist option is not selected then the configuration pins with the exception of CCLK, PROG_B, and DONE can be used as user I/O in normal operation. The persist option does not apply to the boundary-scan related pins. The persist feature is valuable in applications that readback configuration data after entering the User mode.

[Table 22](#) lists the total number of bits required to configure each FPGA as well as the PROMs suitable for storing those bits. See [DS123: Platform Flash In-System Programmable Configuration PROMs](#) data sheet for more information.

The Standard Configuration Interface

Configuration signals belong to one of two different categories: Dedicated or Dual-Purpose. Which category determines which of the FPGA's power rails supplies the signal's driver and, thus, helps describe the electrical at the pin.

The Dedicated configuration pins include PROG_B, HSWAP_EN, TDI, TMS, TCK, TDO, CCLK, DONE, and M0-M2. These pins use the V_{CCAUX} lines for power.

Table 22: Spartan-3 Configuration Data

Device	File Sizes	Xilinx Platform Flash PROM	
		Serial Configuration	Parallel Configuration
XC3S50	439,264	XCF01S	XCF08P
XC3S200	1,047,616	XCF01S	XCF08P
XC3S400	1,699,136	XCF02S	XCF08P
XC3S1000	3,223,488	XCF04S	XCF08P
XC3S1500	5,214,784	XCF08P	XCF08P
XC3S2000	7,673,024	XCF08P	XCF08P
XC3S4000	11,316,864	XCF16P	XCF16P
XC3S5000	13,271,936	XCF16P	XCF16P

The Dual-Purpose configuration pins comprise INIT_B, DOUT, BUSY, RDWR_B, CS_B, and DIN/D0-D7. Each of these pins, according to its bank placement, uses the V_{CCO} lines for either Bank 4 (V_{CCO_4}) or Bank 5 (V_{CCO_5}). All the signals used in the serial configuration modes rely on V_{CCO_4} power. Signals used in the parallel configuration modes and Readback require from V_{CCO_5} as well as from V_{CCO_4}.

Both the Dedicated and Dual-Purpose signals described above constitute the configuration interface. In the standard case, this interface is 2.5V-LVCMOS-compatible. This means that 2.5V is applied to the V_{CCAUX}, V_{CCO_4}, and V_{CCO_5} lines (this last in the parallel or Readback case only). One need only apply 2.5 Volts to these V_{CCO} lines from power-on to the end of configuration. Upon entering the User mode, it is possible to switch to supply voltage permitting signal swings other than 2.5V.

3.3V-Tolerant Configuration Interface

It is possible to achieve 3.3V-tolerance at the configuration interface simply by adding a few external resistors. This approach may prove useful when it is undesirable to switch the VCCO_4 and VCCO_5 voltages from 2.5V to 3.3V after configuration.

The 3.3V-tolerance is implemented as follows (a similar approach can be used for other supply voltage levels):

First, to power the Dual-Purpose configuration pins, apply 3.3V to the VCCO_4 and (as needed) the VCCO_5 lines. This scales the output voltages and input thresholds associated with these pins so that they become 3.3V-compatible.

Second, to power the Dedicated configuration pins, apply 2.5V to the V_{CCAUX} lines (the same as for the standard interface). In order to achieve 3.3V-tolerance, the Dedicated inputs will require series resistors that limit the incoming current to 10mA or less. The Dedicated outputs will need pull-up resistors to ensure adequate noise margin when the FPGA is driving a High logic level into another device's 3.3V receiver. Choose a power regulator or supply that can tolerate reverse current on the V_{CCAUX} lines.

Configuration Modes

Spartan-3 supports the following five configuration modes:

- Slave Serial mode
- Master Serial mode
- Slave Parallel mode
- Master Parallel mode
- Boundary-Scan (JTAG) mode (IEEE 1532/IEEE 1149.1)

Slave Serial Mode

In Slave Serial mode, the FPGA receives configuration data in bit-serial form from a serial PROM or other serial source of configuration data. The FPGA on the far right of **Figure 20** is set for the Slave Serial mode. The CCLK pin on the FPGA is an input in this mode. The serial bitstream must be set up at the DIN input pin a short time before each rising edge of the externally generated CCLK.

Multiple FPGAs can be daisy-chained for configuration from a single source. After a particular FPGA has been configured, the data for the next device is routed internally to the DOUT pin. The data on the DOUT pin changes on the falling edge of CCLK.

DS099_23_041103

Notes:

1. There are two ways to use the DONE line. First, one may set the BitGen option DriveDone to "Yes" only for the last FPGA to be configured in the chain shown above (or for the single FPGA as may be the case). This enables the DONE pin to drive High; thus, no pull-up resistor is necessary. DriveDone is set to "No" for the remaining FPGAs in the chain. Second, DriveDone can be set to "No" for all FPGAs. Then all DONE lines are open-drain and require the pull-up resistor shown in grey. In most cases, a value between 3.3KΩ to 4.7KΩ is sufficient. However, when using DONE synchronously with a long chain of FPGAs, cumulative capacitance may necessitate lower resistor values (e.g. down to 330Ω) in order to ensure a rise time within one clock cycle.
2. For information on how to program the FPGA using 3.3V signals and power, see **3.3V-Tolerant Configuration Interface**.

Figure 20: Connection Diagram for Master and Slave Serial Configuration

Slave Serial mode is selected by applying <111> to the mode pins (M0, M1, and M2). A pull-up on the mode pins makes slave serial the default mode if the pins are left unconnected.

Master Serial Mode

In Master Serial mode, the CCLK pin is an output pin. The FPGA just to the right of the PROM in [Figure 20](#) is set for Master Serial mode. It is the FPGA that drives the configuration clock on the CCLK pin to a Xilinx Serial PROM which in turn feeds bit-serial data to the DIN input. The FPGA accepts this data on each rising CCLK edge. After the FPGA has been loaded, the data for the next device in a daisy-chain is presented on the DOUT pin after the falling CCLK edge.

The interface is identical to slave serial except that an internal oscillator is used to generate the configuration clock (CCLK). A wide range of frequencies can be selected for CCLK which always starts at a default frequency of 6 MHz. Configuration bits then switch CCLK to a higher frequency for the remainder of the configuration.

Slave Parallel Mode

The Parallel modes support the fastest configuration. Byte-wide data is written into the FPGA with a BUSY flag

controlling the flow of data. An external source provides 8-bit-wide data, CCLK, an active-Low Chip Select (CS_B) signal and an active-Low Write signal (RDWR_B). If BUSY is asserted (High) by the FPGA, the data must be held until BUSY goes Low. Data can also be read using the Slave Parallel mode. If RDWR_B is asserted, configuration data is read out of the FPGA as part of a readback operation.

After configuration, it is possible to use any of the Multipurpose pins (DIN/D0-D7, DOUT/BUSY, INITB, CS_B, and RDWR_B) as User I/Os. To do this, simply set the BitGen option *Persist* to *No* and assign the desired signals to multipurpose configuration pins using the Xilinx development software. Alternatively, it is possible to continue using the configuration port (e.g. all configuration pins taken together) when operating in the User mode. This is accomplished by setting the *Persist* option to *Yes*.

Multiple FPGAs can be configured using the Slave Parallel mode and can be made to start-up simultaneously. [Figure 21](#) shows the device connections. To configure multiple devices in this way, wire the individual CCLK, Data, RDWR_B, and BUSY pins of all the devices in parallel. The individual devices are loaded separately by deasserting the CS_B pin of each device in turn and writing the appropriate data.

Notes:

1. There are two ways to use the DONE line. First, one may set the BitGen option DriveDone to "Yes" only for the last FPGA to be configured in the chain shown above (or for the single FPGA as may be the case). This enables the DONE pin to drive High; thus, no pull-up resistor is necessary. DriveDone is set to "No" for the remaining FPGAs in the chain. Second, DriveDone can be set to "No" for all FPGAs. Then all DONE lines are open-drain and require the pull-up resistor shown in grey. In most cases, a value between 3.3KΩ to 4.7KΩ is sufficient. However, when using DONE synchronously with a long chain of FPGAs, cumulative capacitance may necessitate lower resistor values (e.g. down to 330Ω) in order to ensure a rise time within one clock cycle.
2. If the FPGAs use different configuration data files, configure them in sequence by first asserting the CS_B of one FPGA then asserting the CS_B of the other FPGA.
3. For information on how to program the FPGA using 3.3V signals and power, see [3.3V-Tolerant Configuration Interface](#).

Figure 21: Connection Diagram for Slave Parallel Configuration

DS099_25_041103

Notes:

1. There are two ways to use the DONE line. First, one may set the BitGen option DriveDone to "Yes" only for the last FPGA to be configured in the chain shown above (or for the single FPGA as may be the case). This enables the DONE pin to drive High; thus, no pull-up resistor is necessary. DriveDone is set to "No" for the remaining FPGAs in the chain. Second, DriveDone can be set to "No" for all FPGAs. Then all DONE lines are open-drain and require the pull-up resistor shown in grey. In most cases, a value between 3.3KΩ to 4.7KΩ is sufficient. However, when using DONE synchronously with a long chain of FPGAs, cumulative capacitance may necessitate lower resistor values (e.g. down to 330Ω) in order to ensure a rise time within one clock cycle.

Figure 22: Connection Diagram for Master Parallel Configuration

Master Parallel Mode

In this mode, the device is configured byte-wide on a CCLK supplied by the FPGA. Timing is similar to the Slave Parallel mode except that CCLK is supplied by the FPGA. The device connections are shown in Figure 22.

Boundary-Scan (JTAG) Mode

In Boundary-Scan mode, dedicated pins are used for configuring the FPGA. The configuration is done entirely through the IEEE 1149.1 Test Access Port (TAP). FPGA configuration using the Boundary-Scan mode is compliant with the IEEE 1149.1-1993 standard and the new IEEE 1532 standard for In-System Configurable (ISC) devices.

Configuration through the boundary-scan port is always available, independent of the mode selection. Selecting the Boundary-Scan mode simply turns off the other modes.

Configuration Sequence

The configuration of Spartan-3 devices is a three-stage process that occurs after Power-On Reset or the assertion of PROG_B. POR occurs after the VCCINT, VCCAUX, and VCCO Bank 4 supplies have reached their respective maximum input threshold levels (see Table 6 in Module 3: **DC and Switching Characteristics**). After POR, the three-stage process begins.

First, the configuration memory is cleared. Next, configuration data is loaded into the memory, and finally, the logic is activated by a start-up process. A flow diagram for the configuration sequence of the Serial and Parallel modes is shown in Figure 23. The flow diagram for the Boundary-Scan configuration sequence appears in Figure 24.

DS099_26_041103

Figure 23: Configuration Flow Diagram for the Serial and Parallel Modes

DS099_27_041103

Figure 24: Boundary-Scan Configuration Flow Diagram

Configuration is automatically initiated after power-on unless it is delayed by the user. INIT_B is an open-drain line that the FPGA holds Low during the clearing of the configuration memory. Extending the time that the pin is Low causes the configuration sequencer to wait. Thus, configuration is delayed by preventing entry into the phase where data is loaded.

The configuration process can also be initiated by asserting the PROG_B pin. The end of the memory-clearing phase is signaled by the INIT_B pin going High. At this point, the configuration data is written to the FPGA. The FPGA holds the Global Set/Reset (GSR) signal active throughout configuration, keeping all flip-flops on the device in a reset state. The completion of the entire process is signaled by the DONE pin going High.

The default start-up sequence, shown in Figure 25, serves as a transition to the User mode. The default start-up sequence is that one CCLK cycle after DONE goes High, the Global Three-State signal (GTS) is released. This permits device outputs to which signals have been assigned to become active. One CCLK cycle later, the Global Write Enable (GWE) signal is released. This permits the internal storage elements to begin changing state in response to the design logic and the user clock.

The relative timing of configuration events can be changed via the BitGen options in the Xilinx development software. In addition, the GTS and GWE events can be made dependent on the DONE pins of multiple devices all going High, forcing the devices to start synchronously. The sequence can also be paused at any stage, until lock has been achieved on any DCM.

Readback

Using Slave Parallel mode, configuration data from the FPGA can be read back. Readback is supported only in the Slave Parallel and Boundary-Scan modes.

Along with the configuration data, it is possible to read back the contents of all registers, distributed SelectRAM, and block RAM resources. This capability is used for real-time debugging.

Notes:

1. The BitGen option StartupClk in the Xilinx development software selects the CCLK input, TCK input, or a user-designated global clock input (the GCLK0 - GCLK7 pins) for receiving the clock signal that synchronizes Start-Up.

Figure 25: Default Start-Up Sequence

Revision History

Date	Version No.	Description
04/11/03	1.0	Initial Xilinx release
05/19/03	1.1	Added Block RAM column, DCMs, and multipliers to XC3S50 descriptions.
07/11/03	1.2	Explained the configuration port <i>Persist</i> option in Slave Parallel Mode section. Updated Figure 2 and Double-Data-Rate Transmission section to indicate that DDR clocking for the XC3S50 is the same as that for all other Spartan-3 devices. Updated description of I/O voltage tolerance in ESD Protection section. In Table 6 , changed input termination type for DCI version of the LVCMOS standard to <i>None</i> . Added additional flexibility for making DLL connections in Figure 15 and accompanying text. In the Configuration section, inserted an explanation of how to choose power supplies for the configuration interface, including guidelines for achieving 3.3V-tolerance.
08/24/04	1.3	Showed inversion of 3-state signal (Figure 1). Clarified description of pull-up and pull-down resistors (Table 2 and page 4). Added information on operating block RAM with multipliers to page 13 . Corrected output buffer name in Figure 15 . Corrected description of how DOUT is synchronized to CCLK (page 33).

The Spartan-3 Family Data Sheet

DS099-1, *Spartan-3 FPGA Family: **Introduction and Ordering Information*** (Module 1)

DS099-2, *Spartan-3 FPGA Family: **Functional Description*** (Module 2)

DS099-3, *Spartan-3 FPGA Family: **DC and Switching Characteristics*** (Module 3)

DS099-4, *Spartan-3 FPGA Family: **Pinout Descriptions*** (Module 4)

DC Electrical Characteristics

In this section, specifications may be designated as Advance, Preliminary, or Production. These terms are defined as follows:

Advance: Initial estimates are based on simulation, early characterization, and/or extrapolation from the characteristics of other families. Values are subject to change. Use as estimates, not for production.

Preliminary: Based on characterization. Further changes are not expected.

Production: These specifications are approved once the silicon has been characterized over numerous production lots. Parameter values are considered stable with no future changes expected.

All parameter limits are representative of worst-case supply voltage and junction temperature conditions. **The following applies unless otherwise noted: The parameter values**

published in this module apply to all Spartan™-3 devices. AC and DC characteristics are specified using the same numbers for both commercial and industrial grades. All parameters representing voltages are measured with respect to GND.

Some specifications list different values for one or more die revisions. All presently available Spartan-3 devices are classified as revision 0. Future updates to this module will introduce further die revisions as needed.

If a particular Spartan-3 FPGA differs in functional behavior or electrical characteristic from this data sheet, those differences are described in a separate errata document. The errata documents for Spartan-3 FPGAs are living documents and are available online. For directions on accessing the errata documents, go to www.xilinx.com/support and search for Answer Record #18815.

Table 1: Absolute Maximum Ratings

Symbol	Description	Conditions		Min	Max	Units
V _{CCINT}	Internal supply voltage			−0.5	1.32	V
V _{CCAUX}	Auxiliary supply voltage			−0.5	3.00	V
V _{CCO}	Output driver supply voltage			−0.5	3.75	V
V _{REF}	Input reference voltage			−0.5	V _{CCO} + 0.5 ⁽³⁾	V
V _{IN} ⁽²⁾	Voltage applied to all User I/O pins and Dual-Purpose pins	Driver in a high-impedance state		−0.5	V _{CCO} + 0.5 ⁽³⁾	V
	Voltage applied to all Dedicated pins			−0.5	V _{CCAUX} + 0.5 ⁽⁴⁾	V
V _{ESD}	Electrostatic Discharge Voltage	Human body model	XC3S50	−1500	+1500	V
			Other	−2000	+2000	V
		Charged device model		−500	+500	V
		Machine model	XC3S50, XC3S400, XC3S1500	−200	+200	V

Table 1: Absolute Maximum Ratings (Continued)

Symbol	Description	Conditions	Min	Max	Units
T_J	Junction temperature	$V_{CCO} \leq 3.0V$	-	125	$^{\circ}C$
		$V_{CCO} > 3.0V$	-	105	$^{\circ}C$
T_{STG}	Storage temperature		-65	150	$^{\circ}C$

Notes:

- Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time adversely affects device reliability.
- As a rule, the V_{IN} limits apply to both the DC and AC components of signals. Simple application solutions are available that show how to handle overshoot/undershoot as well as achieve PCI compliance. Refer to the following application notes: "Virtex-II Pro™ and Spartan-3 3.3V PCI Reference Design" ([XAPP653](#)) and "Using 3.3V I/O Guidelines in a Virtex-II Pro Design" ([XAPP659](#)).
- All User I/O and Dual-Purpose pins (DIN/D0, D1–D7, CS_B, RDWR_B, BUSY/DOUT, and INIT_B) draw power from the V_{CCO} power rail of the associated bank. Meeting the V_{IN} max limit ensures that the internal diode junctions that exist between each of these pins and the V_{CCO} rail do not turn on. [Table 5](#) specifies the V_{CCO} range used to determine the max limit. When V_{CCO} is at its maximum recommended operating level (3.45V), V_{IN} max is 3.95V. The maximum voltage that avoids oxide stress is $V_{INX} = 4.05V$. As long as the V_{IN} max specification is met, oxide stress is not possible.
- All Dedicated pins (M0–M2, CCLK, PROG_B, DONE, HSWAP_EN, TCK, TDI, TDO, and TMS) draw power from the V_{CCAUX} rail (2.5V). Meeting the V_{IN} max limit ensures that the internal diode junctions that exist between each of these pins and the V_{CCAUX} rail do not turn on. [Table 5](#) specifies the V_{CCAUX} range used to determine the max limit. When V_{CCAUX} is at its maximum recommended operating level (2.625V), V_{IN} max $\leq 3.125V$. As long as the V_{IN} max specification is met, oxide stress is not possible. For information concerning the use of 3.3V signals, see the [3.3V-Tolerant Configuration Interface](#) section in Module 2: [Functional Description](#).
- For soldering guidelines, see "Device Packaging and Thermal Characteristics" at www.xilinx.com/bvdocs/userguides/ug112.pdf.

Table 2: Supply Voltage Thresholds for Power-On Reset

Symbol	Description	Min	Max	Units
V_{CCINTT}	Threshold for the V_{CCINT} supply	0.4	1.0	V
V_{CCAUXT}	Threshold for the V_{CCAUX} supply	0.8	2.0	V
V_{CCO4T}	Threshold for the V_{CCO} Bank 4 supply	0.4	1.0	V

Notes:

- V_{CCINT} , V_{CCAUX} , and V_{CCO} supplies may be applied in any order. When applying V_{CCINT} power before V_{CCAUX} power, the FPGA may draw a *surplus* current in addition to the quiescent current levels specified in [Table 7](#). Applying V_{CCAUX} eliminates the surplus current. The FPGA does not use any of the surplus current for the power-on process. For this power sequence, make sure that regulators with foldback features will not shut down inadvertently.
- To ensure successful power-on, V_{CCINT} , V_{CCO} Bank 4, and V_{CCAUX} supplies must rise through their respective threshold-voltage ranges with no dips at any point.

Table 3: Power Voltage Ramp Time Requirements

Symbol	Description	Device	Package	Min	Max	Units
T_{CCO}	V_{CCO} ramp time for all eight banks	XC3S50	All	No limit	-	ms
		XC3S200	FT and FG	0.6	-	ms
			Other	2.0	-	ms
		XC3S400	FT and FG	0.6	-	ms
			Other	2.0	-	ms
		XC3S1000	All	No limit	-	ms
		XC3S1500	FT and FG	0.6	-	ms
			Other	2.0	-	ms
		XC3S2000	All	2.0	-	ms
		XC3S4000	All	2.0	-	ms
		XC3S5000	All	2.0	-	ms

Notes:

1. This specification is based on characterization. It applies to Revision 0 devices and will be improved in the future.
2. The ramp time is measured from 10% to 90% of the full nominal voltage swing for all I/O standards.
3. At present, there are no ramp requirements for the V_{CCINT} and V_{CCAUX} supplies.
4. For information on power-on current needs, see Note 3 of [Table 7](#).

Table 4: Power Voltage Levels Necessary for Preserving RAM Contents

Symbol	Description	Min	Units
V_{DRINT}	V_{CCINT} level required to retain RAM data	1.0	V
V_{DRAUX}	V_{CCAUX} level required to retain RAM data	2.0	V

Notes:

1. RAM contents include configuration data.
2. The level of the V_{CCO} supply has no effect on data retention.

Table 5: General Recommended Operating Conditions

Symbol	Description		Min	Nom	Max	Units
T _J	Junction temperature	Commercial	0	-	85	°C
		Industrial	−40	-	100	°C
V _{CCINT}	Internal supply voltage		1.140	1.200	1.260	V
V _{CCO} ⁽¹⁾	Output driver supply voltage		1.140	-	3.450	V
V _{CCAUX}	Auxiliary supply voltage		2.375	2.500	2.625	V

Notes:

1. The V_{CCO} range given here spans the lowest and highest operating voltages of all supported I/O standards. The recommended V_{CCO} range specific to each of the single-ended I/O standards is given in Table 8, and that specific to the differential standards is given in Table 10.

Table 6: General DC Characteristics of User I/O, Dual-Purpose, and Dedicated Pins

Symbol	Description	Device Revision	Test Conditions		Min	Typ	Max	Units
$I_L^{(2)}$	Leakage current at User I/O, Dual-Purpose, and Dedicated pins	0	Driver is in a high-impedance state, $V_{IN} = 0V$ or V_{CCO} max, sample-tested	$V_{CCO} \geq 3.0V$	−25	-	+25	μA
		$V_{CCO} < 3.0V$		−10	-	+10	μA	
		Future		All V_{CCO} levels	−10	-	+10	μA
$I_{RPU}^{(3)}$	Current through pull-up resistor at User I/O, Dual-Purpose, and Dedicated pins	All	$V_{IN} = 0V, V_{CCO} = 3.3V$	−0.84	-	−2.35	mA	
			$V_{IN} = 0V, V_{CCO} = 3.0V$	−0.69	-	−1.99	mA	
			$V_{IN} = 0V, V_{CCO} = 2.5V$	−0.47	-	−1.41	mA	
			$V_{IN} = 0V, V_{CCO} = 1.8V$	−0.21	-	−0.69	mA	
			$V_{IN} = 0V, V_{CCO} = 1.5V$	−0.13	-	−0.43	mA	
			$V_{IN} = 0V, V_{CCO} = 1.2V$	−0.06	-	−0.22	mA	
$I_{RPD}^{(3)}$	Current through pull-down resistor at User I/O, Dual-Purpose, and Dedicated pins	All	$V_{IN} = V_{CCO}$	0.37	-	1.67	mA	
I_{REF}	V_{REF} current per pin	0	$V_{CCO} \geq 3.0V$	−25	-	+25	μA	
			$V_{CCO} < 3.0V$	−10	-	+10	μA	
		Future	All V_{CCO} levels	−10	-	+10	μA	
C_{IN}	Input capacitance	All		3	-	10	pF	

Notes:

1. The numbers in this table are based on the conditions set forth in Table 5.
2. The I_L specification applies to every I/O pin throughout power-on as long as the voltage on that pin stays between the absolute V_{IN} minimum and maximum values (Table 1). For hot-swap applications, at the time of card connection, be sure to keep all I/O voltages within this range before applying V_{CCO} power. Also consider applying V_{CCO} power before the connection of data lines occurs. When the FPGA is completely unpowered, the impedance at the I/O pins is high.
3. This parameter is based on characterization. The pull-up resistance $R_{PU} = V_{CCO} / I_{RPU}$. The pull-down resistance $R_{PD} = V_{IN} / I_{RPD}$. Spartan-3 family values for both resistances are stronger than they have been for previous FPGA families.

Table 7: Quiescent Supply Current Characteristics

Symbol	Description	Device	Typ	Max	Units
I _{CCINTQ}	Quiescent V _{CCINT} supply current	XC3S50	10.0	25.0	mA
		XC3S200	20.0	70.0	mA
		XC3S400	35.0	100.0	mA
		XC3S1000	65.0	190.0	mA
		XC3S1500	65.0	250.0	mA
		XC3S2000			mA
		XC3S4000			mA
		XC3S5000			mA
I _{CCOQ}	Quiescent V _{CCO} supply current	XC3S50	1.5	10.0	mA
		XC3S200	1.5	10.0	mA
		XC3S400	1.5	12.0	mA
		XC3S1000	2.0	12.0	mA
		XC3S1500	2.5	14.0	mA
		XC3S2000			mA
		XC3S4000			mA
		XC3S5000			mA
I _{CCAUXQ}	Quiescent V _{CCAUX} supply current	XC3S50	10.0	20.0	mA
		XC3S200	15.0	30.0	mA
		XC3S400	20.0	40.0	mA
		XC3S1000	25.0	50.0	mA
		XC3S1500	40.0	75.0	mA
		XC3S2000			mA
		XC3S4000			mA
		XC3S5000			mA

Notes:

1. The numbers in this table are based on the conditions set forth in Table 5. Quiescent supply current is measured with all I/O drivers in a high-impedance state and with all pull-up/pull-down resistors at the I/O pads disabled. For typical values, the ambient temperature (T_A) is 25°C with V_{CCINT} = 1.2V, V_{CCO} = 2.5V, and V_{CCAUX} = 2.5V. The FPGA is programmed with a "blank" configuration data file (i.e., a design with no functional elements instantiated). For conditions other than those described above, (e.g., a design including functional elements, the use of DCI standards, etc.), measured quiescent current levels may be higher than the values in the table. Use the Web Power Tool or XPower for more accurate estimates. See Note 2.
2. There are two recommended ways to estimate the total power consumption (quiescent plus dynamic) for a specific design: a) The Spartan-3 Web Power Tool at http://www.xilinx.com/ise/power_tools provides quick, approximate, typical estimates, and does not require a netlist of the design. b) XPower, part of the Xilinx development software, takes a netlist as input to provide more accurate maximum and typical estimates.
3. The maximum numbers in this table indicate the minimum current each power rail requires in order for the FPGA to power-on successfully.

Table 8: Recommended Operating Conditions for User I/Os Using Single-Ended Standards

Signal Standard	V _{CCO}			V _{REF}			V _{IL}	V _{IH}
	Min (V)	Nom (V)	Max (V)	Min (V)	Nom (V)	Max (V)	Max (V)	Min (V)
GTL ⁽³⁾	-	-	-	0.74	0.8	0.86	V _{REF} - 0.05	V _{REF} + 0.05
GTL_DCI	-	1.5	-	0.74	0.8	0.86	V _{REF} - 0.05	V _{REF} + 0.05
GTLP ⁽³⁾	-	-	-	0.88	1	1.12	V _{REF} - 0.1	V _{REF} + 0.1
GTLP_DCI	-	1.5	-	0.88	1	1.12	V _{REF} - 0.1	V _{REF} + 0.1
HSTL_I, HSTL_I_DCI	1.4	1.5	1.6	0.68	0.75	0.9	V _{REF} - 0.1	V _{REF} + 0.1
HSTL_III, HSTL_III_DCI	1.4	1.5	1.6	-	0.9	-	V _{REF} - 0.1	V _{REF} + 0.1
HSTL_I_18, HSTL_I_DCI_18	1.7	1.8	1.9	0.8	0.9	1.1	V _{REF} - 0.1	V _{REF} + 0.1

HSTL_III_18, HSTL_III_DCI_18	1.7	1.8	1.9	-	1.1	-	V _{REF} - 0.1	V _{REF} + 0.1
LVC MOS12 ⁽⁴⁾	1.14	1.2	1.3	-	-	-	0.20V _{CCO}	0.58V _{CCO}
LVC MOS15, LVDCI_15, LVDCI_DV2_15 ⁽⁴⁾	1.4	1.5	1.6	-	-	-	0.20V _{CCO}	0.70V _{CCO}
LVC MOS18, LVDCI_18, LVDCI_DV2_18 ⁽⁴⁾	1.7	1.8	1.9	-	-	-	0.20V _{CCO}	0.70V _{CCO}
LVC MOS25 ^(4,5) , LVDCI_25, LVDCI_DV2_25 ⁽⁴⁾	2.3	2.5	2.7	-	-	-	0.7	1.7
LVC MOS33, LVDCI_33, LVDCI_DV2_33 ⁽⁴⁾	3.0	3.3	3.45	-	-	-	0.8	2.0
LVTTL	3.0	3.3	3.45	-	-	-	0.8	2.0
PCI33_3 ⁽⁷⁾	-	3.0	-	-	-	-	0.30V _{CCO}	0.50V _{CCO}
SSTL18_I, SSTL18_I_DCI	1.65	1.8	1.95	0.825	0.9	0.975	V _{REF} - 0.125	V _{REF} + 0.125
SSTL2_I, SSTL2_I_DCI	2.3	2.5	2.7	1.15	1.25	1.35	V _{REF} - 0.15	V _{REF} + 0.15
SSTL2_II, SSTL2_II_DCI	2.3	2.5	2.7	1.15	1.25	1.35	V _{REF} - 0.15	V _{REF} + 0.15

Notes:

- Descriptions of the symbols used in this table are as follows:
V_{CCO} -- the supply voltage for output drivers as well as LVC MOS, LVTTL, and PCI inputs
V_{REF} -- the reference voltage for setting the input switching threshold
V_{IL} -- the input voltage that indicates a Low logic level
V_{IH} -- the input voltage that indicates a High logic level
- For device operation, the maximum signal voltage (V_{IH} max) may be as high as V_{IN} max. See Table 1.
- Because the GTL and GTLP standards employ open-drain output buffers, V_{CCO} lines do not supply current to the I/O circuit, rather this current is provided using an external pull-up resistor connected from the I/O pin to a termination voltage (V_{TT}). Nevertheless, the voltage applied to the associated V_{CCO} lines must always be at or above V_{TT} and I/O pad voltages.
- There is approximately 100 mV of hysteresis on inputs using any LVC MOS standard.
- All Dedicated pins (M0-M2, CCLK, PROG_B, DONE, HSWAP_EN, TCK, TDI, TDO, and TMS) use the LVC MOS25 standard and draw power from the V_{CCAUX} rail (2.5V). The Dual-Purpose configuration pins (DIN/D0, D1-D7, CS_B, RDWR_B, BUSY/DOUT, and INIT_B) use the LVC MOS25 standard before the User mode. For these pins, apply 2.5V to the V_{CCO} Bank 4 and V_{CCO} Bank 5 rails at power-on as well as throughout configuration. For information concerning the use of 3.3V signals, see the **3.3V-Tolerant Configuration Interface** section in Module 2: **Functional Description**.
- The Global Clock Inputs (GCLK0-GCLK7) are Dual-Purpose pins to which any signal standard may be assigned.
- For more information, see "Virtex-II Pro and Spartan-3 3.3V PCI Reference Design" ([XAPP653](#)).

SSTL2_II_DCI ⁽⁷⁾		Note 3	Note 3		

Notes:

- The numbers in this table are based on the conditions set forth in [Table 5](#) and [Table 8](#).
- Descriptions of the symbols used in this table are as follows:
I_{OL} -- the output current condition under which V_{OL} is tested
I_{OH} -- the output current condition under which V_{OH} is tested
V_{OL} -- the output voltage that indicates a Low logic level
V_{OH} -- the output voltage that indicates a High logic level
V_{IL} -- the input voltage that indicates a Low logic level
V_{IH} -- the input voltage that indicates a High logic level
V_{CCO} -- the supply voltage for output drivers as well as LVCMOS, LVTTTL, and PCI inputs
V_{REF} -- the reference voltage for setting the input switching threshold
V_{TT} -- the voltage applied to a resistor termination
- Tested according to the standard's relevant specifications. When using the DCI version of a standard on a given I/O bank, that bank will consume more power than if the non-DCI version had been used instead. The additional power is drawn for the purpose of impedance-matching at the I/O pins. A portion of this power is dissipated in the two R_{REF} resistors.
- For the LVCMOS and LVTTTL standards: the same V_{OL} and V_{OH} limits apply for both the Fast and Slow slew attributes.
- All Dedicated output pins (CCLK, DONE, and TDO) as well as Dual-Purpose totem-pole output pins (D0-D7 and BUSY/DOUT) exhibit the characteristics of LVCMOS25 with 12 mA drive and Fast slew rate. For information concerning the use of 3.3V signals, see the [3.3V-Tolerant Configuration Interface](#) section in Module 2: [Functional Description](#).
- Tested according to the relevant PCI specifications. For more information, see "Virtex-II Pro and Spartan-3 3.3V PCI Reference Design" ([XAPP653](#)).
- The minimum usable V_{TT} voltage is 1.25V.

Figure 1: Differential Input Voltages

Table 10: Recommended Operating Conditions for User I/Os Using Differential Signal Standards

Signal Standard	$V_{CCO}^{(1)}$			V_{ID}			V_{ICM}			V_{IH}		V_{IL}	
	Min (V)	Nom (V)	Max (V)	Min (mV)	Nom (mV)	Max (mV)	Min (V)	Nom (V)	Max (V)	Min (V)	Max (V)	Min (V)	Max (V)
LDT_25 (ULVDS_25)	2.375	2.50	2.625	200	600	1000	0.44	0.60	0.78	-	-	-	-
LVDS_25, LVDS_25_DCI	2.375	2.50	2.625	100	350	600	0.30	1.25	2.20	-	-	-	-
BLVDS_25	2.375	2.50	2.625	-	350	-	-	1.25	-	-	-	-	-
LVDSEXT_25, LVDSEXT_25_DCI	2.375	2.50	2.625	100	540	1000	0.30	1.20	2.20	-	-	-	-
LVPECL_25	2.375	2.50	2.625	100	-	-	-	-	-	0.8	2.0	0.5	1.7
RSDS_25	2.375	2.50	2.625	100	200	-	-	1.20	-	-	-	-	-

Notes:

1. V_{CCO} only supplies differential output drivers, not input circuits.
2. V_{REF} inputs are not used for any of the differential I/O standards.
3. V_{ID} is a differential measurement.

	Future	100	-	400	-	-	1.1	-	1.4	-	-	1.15	1.60	0.90	1.35

Notes:

- The numbers in this table are based on the conditions set forth in Table 5 and Table 10.
- V_{OD} , ΔV_{OD} , and ΔV_{OCM} are differential measurements.
- This value must be compatible with the receiver to which the FPGA's output pair is connected.
- Output voltage measurements for all differential standards are made with a termination resistor (R_T) of 100 Ω across the N and P pins of the differential signal pair.
- At any given time, only one differential standard may be assigned to each bank.
- Each LVPECL output-pair requires three external resistors: a 70 Ω resistor in series with each output followed by a 240 Ω shunt resistor. These are in addition to the external 100 Ω termination resistor at the receiver side. See Figure 3.

Figure 3: External Terminations for LVPECL

Switching Characteristics

All Spartan-3 devices are available in two speed grades: –4 and the higher performance –5. Switching characteristics in this document may be designated as Advance, Preliminary, or Production. Each category is defined as follows:

Advance: These specifications are based on simulations only and are typically available soon after establishing FPGA specifications. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur. *All –5 grade numbers are engineering targets: characterization is still in progress.*

Preliminary: These specifications are based on complete early silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting preliminary delays is greatly reduced compared to Advance data.

Production: These specifications are approved once enough production silicon of a particular device family member has been characterized to provide full correlation between speed files and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

All specified limits are representative of worst-case supply voltage and junction temperature conditions. Unless otherwise noted, the following applies: Parameter values apply to

all Spartan-3 devices. All parameters representing voltages are measured with respect to GND.

Timing parameters and their representative values are selected for inclusion below either because they are important as general design requirements or they indicate fundamental device performance characteristics. The Spartan-3 speed files (v1.32), part of the Xilinx Development Software, are the original source for many but not all of the values. The speed grade designations for these files are shown in [Table 12](#). For more complete, more precise, and worst-case data, use the values reported by the Xilinx static timing analyzer (TRACE in the Xilinx development software) and back-annotated to the simulation netlist.

Table 12: Spartan-3 v1.32 Speed Grade Designations

Device	Advance	Preliminary	Production
XC3S50	–4, –5		
XC3S200	–5		–4
XC3S400	–5		–4
XC3S1000	–4, –5		
XC3S1500	–4, –5		
XC3S2000	–4, –5		
XC3S4000	–4, –5		
XC3S5000	–4, –5		

I/O Timing

Table 13: Pin-to-Pin Clock-to-Output Times for the IOB Output Path

Symbol	Description	Conditions	Device	Speed Grade		Units
				-5	-4	
				Max	Max	
Clock-to-Output Times

			XC3S4000	4.27	4.90	ns
			XC3S5000	4.44	5.07	ns

Notes:

1. The numbers in this table are tested using the methodology presented in Table 21 and are based on the operating conditions set forth in Table 5 and Table 8.
2. This clock-to-output time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or a standard other than LVCMOS25 with 12 mA drive and Fast slew rate is assigned to the data Output. If the former is true, add the appropriate Input adjustment from Table 17. If the latter is true, add the appropriate Output adjustment from Table 20.
3. DCM output jitter is included in all measurements.

Table 14: Pin-to-Pin Setup and Hold Times for the IOB Input Path

Symbol	Description	Conditions	Device	Speed Grade		Units
				-5	-4	
				Min	Min	
Setup Times						
T _{PSDCM}	When writing to the Input Flip-Flop (IFF), the time from the setup of data at the Input pin to the active transition at a Global Clock pin. The DCM is in use. No Input Delay is programmed.	LVCMOS25 ⁽²⁾ , IOBDELAY = NONE, with DCM ⁽⁴⁾	XC3S50	2.14	2.35	ns
			XC3S200	2.14	2.35	ns
			XC3S400	2.15	2.36	ns
			XC3S1000	2.42	2.67	ns
			XC3S1500	2.48	2.73	ns
			XC3S2000	2.55	2.81	ns
			XC3S4000	2.60	2.87	ns
			XC3S5000	2.71	2.99	ns
T _{PSFD}	When writing to IFF, the time from the setup of data at the Input pin to an active transition at the Global Clock pin. The DCM is not in use. The Input Delay is programmed.	LVCMOS25 ⁽²⁾ , IOBDELAY = IFD, without DCM	XC3S50	2.03	2.34	ns
			XC3S200	2.63	3.02	ns
			XC3S400	2.50	2.87	ns
			XC3S1000	2.68	3.08	ns
			XC3S1500	3.34	3.84	ns
			XC3S2000	3.58	4.12	ns
			XC3S4000	3.91	4.49	ns
			XC3S5000	4.05	4.67	ns
Hold Times						
T _{PHDCM}	When writing to IFF, the time from the active transition at the Global Clock pin to the point when data must be held at the Input pin. The DCM is in use. No Input Delay is programmed.	LVCMOS25 ⁽³⁾ , IOBDELAY = NONE, with DCM ⁽⁴⁾	XC3S50	−0.12	−0.05	ns
			XC3S200	−0.12	−0.05	ns
			XC3S400	−0.12	−0.05	ns
			XC3S1000	−0.32	−0.28	ns
			XC3S1500	−0.32	−0.28	ns
			XC3S2000	−0.32	−0.27	ns
			XC3S4000	−0.32	−0.27	ns
			XC3S5000	−0.31	−0.27	ns
T _{PHFD}	When writing to IFF, the time from the active transition at the Global Clock pin to the point when data must be held at the Input pin. The DCM is not in use. The Input Delay is programmed.	LVCMOS25 ⁽³⁾ , IOBDELAY = IFD, without DCM	XC3S50	0.08	0.09	ns
			XC3S200	−0.46	−0.46	ns
			XC3S400	−0.32	−0.32	ns
			XC3S1000	−0.45	−0.45	ns
			XC3S1500	−0.97	−0.97	ns
			XC3S2000	−1.08	−1.08	ns
			XC3S4000	−1.31	−1.31	ns
			XC3S5000	−1.29	−1.29	ns

Notes:

1. The numbers in this table are tested using the methodology presented in Table 21 and are based on the operating conditions set forth in Table 5 and Table 8.
2. This setup time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or the data Input. If this is true of the Global Clock Input, *subtract* the appropriate adjustment from Table 17. If this is true of the data Input, *add* the appropriate Input adjustment from the same table.
3. This hold time requires adjustment whenever a signal standard other than LVCMOS25 is assigned to the Global Clock Input or the data Input. If this is true of the Global Clock Input, *add* the appropriate Input adjustment from Table 17. If this is true of the data Input, *subtract* the appropriate Input adjustment from the same table. When the hold time is negative, it is possible to change the data before the clock's active edge.
4. DCM output jitter is included in all measurements.

Table 15: Setup and Hold Times for the IOB Input Path

Symbol	Description	Conditions	Device	Speed Grade		Units
				-5	-4	
				Min	Min	
Setup Times						
T _{IOIPICK}	Time from the setup of data at the Input pin to the active transition at the ICLK input of the Input Flip-Flop (IFF). No Input Delay is programmed.	LVC MOS25 ⁽²⁾ , IOBDELAY = NONE	All	1.65	1.89	ns
T _{IOIPICKD}	Time from the setup of data at the Input pin to the active transition at the IFF's ICLK input. The Input Delay is programmed.	LVC MOS25 ⁽²⁾ , IOBDELAY = IFD	XC3S50	3.14	3.61	ns
			XC3S200	3.54	4.07	ns
			XC3S400	3.59	4.12	ns
			XC3S1000	3.84	4.41	ns
			XC3S1500	4.16	4.78	ns
			XC3S2000	4.36	5.01	ns
			XC3S4000	4.71	5.41	ns
			XC3S5000	4.88	5.61	ns
Hold Times						
T _{IOICKP}	Time from the active transition at the IFF's ICLK input to the point where data must be held at the Input pin. No Input Delay is programmed.	LVC MOS25 ⁽³⁾ , IOBDELAY = NONE	All	−0.55	−0.63	ns
T _{IOICKPD}	Time from the active transition at the IFF's ICLK input to the point where data must be held at the Input pin. The Input Delay is programmed.	LVC MOS25 ⁽³⁾ , IOBDELAY = IFD	XC3S50	−1.45	−1.67	ns
			XC3S200	−1.73	−1.99	ns
			XC3S400	−1.76	−2.03	ns
			XC3S1000	−1.94	−2.23	ns
			XC3S1500	−2.17	−2.49	ns
			XC3S2000	−2.31	−2.65	ns
			XC3S4000	−2.55	−2.93	ns
			XC3S5000	−2.67	−3.07	ns

Notes:

1. The numbers in this table are tested using the methodology presented in Table 21 and are based on the operating conditions set forth in Table 5 and Table 8.
2. This setup time requires adjustment whenever a signal standard other than LVC MOS25 is assigned to the data Input. If this is true, add the appropriate Input adjustment from Table 17.
3. These hold times require adjustment whenever a signal standard other than LVC MOS25 is assigned to the data Input. If this is true, subtract the appropriate Input adjustment from Table 17. When the hold time is negative, it is possible to change the data before the clock's active edge.

Table 16: Propagation Times for the IOB Input Path

Symbol	Description	Conditions	Device	Speed Grade		Units
				-5	-4	
				Max	Max	
Propagation Times						
T _{IOPI}	The time it takes for data to travel from the Input pin to the IOB's I output with no input delay programmed	LVC MOS25 ⁽²⁾ , IOBDELAY = NONE	All	1.69	1.94	ns
T _{IOPID}	The time it takes for data to travel from the Input pin to the I output with the Input delay programmed	LVC MOS25 ⁽²⁾ , IOBDELAY = IFD	XC3S50	2.56	2.94	ns
			XC3S200	2.96	3.40	ns
			XC3S400	3.01	3.45	ns
			XC3S1000	3.26	3.74	ns
			XC3S1500	3.58	4.11	ns
			XC3S2000	3.78	4.34	ns
			XC3S4000	4.13	4.74	ns
			XC3S5000	4.30	4.94	ns
T _{IOPLI}	The time it takes for data to travel from the Input pin through the IFF latch to the I output with no input delay programmed	LVC MOS25 ⁽²⁾ , IOBDELAY = NONE	All	2.41	2.77	ns
T _{IOPLID}	The time it takes for data to travel from the Input pin through the IFF latch to the I output with the input delay programmed	LVC MOS25 ⁽²⁾ , IOBDELAY = IFD	XC3S50	3.28	3.77	ns
			XC3S200	3.68	4.23	ns
			XC3S400	3.72	4.28	ns
			XC3S1000	3.97	4.57	ns
			XC3S1500	4.30	4.94	ns
			XC3S2000	4.50	5.17	ns
			XC3S4000	4.84	5.57	ns
			XC3S5000	5.02	5.77	ns

Notes:

1. The numbers in this table are tested using the methodology presented in Table 21 and are based on the operating conditions set forth in Table 5 and Table 8.
2. This propagation time requires adjustment whenever a signal standard other than LVC MOS25 is assigned to the data Input. When this is true, add the appropriate Input adjustment from Table 17.

Table 17: Input Timing Adjustments for IOB

Convert Input Time from LVCMOS25 to the Following Signal Standard	Add the Adjustment Below		Units
	Speed Grade

Notes:

1. The numbers in this table are tested using the methodology presented in [Table 21](#) and are based on the operating conditions set forth in [Table 5](#), [Table 8](#), and [Table 10](#).
2. These adjustments are used to convert input path times originally specified for the LVC MOS25 standard to times that correspond to other signal standards.

Table 18: Timing for the IOB Output Path

Symbol	Description	Conditions	Speed Grade		Units
			-5	-4	
			Max	Max	
Clock-to-Output Times					
T _{IOCKP}	When reading from the Output Flip-Flop (OFF), the time from the active transition at the OTCLK input to data appearing at the Output pin	LVC MOS25 ⁽²⁾ , 12mA output drive, Fast slew rate	1.50	1.72	ns
Propagation Times					
T _{IOOP}	The time it takes for data to travel from the IOB's O input to the Output pin	LVC MOS25 ⁽²⁾ , 12mA output drive, Fast slew rate	1.28	1.46	ns
T _{IOOLP}	The time it takes for data to travel from the O input through the OFF latch to the Output pin		1.50	1.72	ns
Set/Reset Times					
T _{IOSRP}	Time from asserting the OFF's SR input to setting/resetting data at the Output pin	LVC MOS25 ⁽²⁾ , 12mA output drive, Fast slew rate	2.18	2.51	ns
T _{IOGSRQ}	Time from asserting the Global Set Reset (GSR) net to setting/resetting data at the Output pin		8.07	9.28	ns

Notes:

1. The numbers in this table are tested using the methodology presented in Table 21 and are based on the operating conditions set forth in Table 5 and Table 8.
2. This time requires adjustment whenever a signal standard other than LVC MOS25 with 12 mA drive and Fast slew rate is assigned to the data Output. When this is true, add the appropriate Output adjustment from Table 20.

Table 19: Timing for the IOB Three-State Path

Symbol	Description	Conditions	Speed Grade		Units
			-5	-4	
			Max	Max	
Synchronous Output Enable/Disable Times					
T _{IOCKHZ}	Time from the active transition at the OTCLK input of the Three-state Flip-Flop (TFF) to when the Output pin enters the high-impedance state	LVCMOS25, 12mA output drive, Fast slew rate	0.95	1.09	ns
T _{IOCKON} ⁽²⁾	Time from the active transition at TFF's OTCLK input to when the Output pin drives valid data		1.64	1.88	ns
Asynchronous Output Enable/Disable Times					
T _{GTS}	Time from asserting the Global Three State net (GTS) net to when the Output pin enters the high-impedance state	LVCMOS25, 12mA output drive, Fast slew rate	7.03	8.08	ns
Set/Reset Times					
T _{IOSRHZ}	Time from asserting TFF's SR input to when the Output pin enters a high-impedance state	LVCMOS25, 12mA output drive, Fast slew rate	1.71	1.96	ns
T _{IOSRON} ⁽²⁾	Time from asserting TFF's SR input at TFF to when the Output pin drives valid data		2.40	2.75	ns

Notes:

1. The numbers in this table are tested using the methodology presented in Table 21 and are based on the operating conditions set forth in Table 5 and Table 8.
2. This time requires adjustment whenever a signal standard other than LVCMOS25 with 12 mA drive and Fast slew rate is assigned to the data Output. When this is true, add the appropriate Output adjustment from Table 20.

Notes:

1. The numbers in this table are tested using the methodology presented in Table 21 and are based on the operating conditions set forth in Table 5, Table 8, and Table 10.
2. These adjustments are used to convert output- and three-state-path times originally specified for the LVCMOS25 standard with 12 mA drive and Fast slew rate to times that correspond to other signal standards. Do not adjust times that measure when outputs go into a high-impedance state.

Timing Measurement Methodology

When measuring timing parameters at the programmable I/Os, different signal standards call for different test conditions. Table 21 presents the conditions to use for each standard.

The method for measuring Input timing is as follows: A signal that swings between a Low logic level of V_L and a High logic level of V_H is applied to the Input under test. Some standards also require the application of a bias voltage to the V_{REF} pins of a given bank to properly set the input-switching threshold. The measurement point of the Input signal (V_M) is commonly located halfway between V_L and V_H .

The Output test setup is shown in Figure 4. A termination voltage V_T is applied to the termination resistor R_T , the other end of which is connected to the Output. For each standard, R_T and V_T generally take on the standard values recommended for minimizing signal reflections. If the standard does not ordinarily use terminations (e.g., LVCMOS,

LVTTL), then R_T is set to $1M\Omega$ to indicate an open connection, and V_T is set to zero. The same measurement point (V_M) that was used at the Input is also used at the Output.

ds099-3_07_012004

Notes:

1. The names shown in parentheses are used in the IBIS file.

Figure 4: Output Test Setup

Table 21: Test Methods for Timing Measurement at I/Os

Signal Standard	Inputs			Outputs		Inputs and Outputs
	V_{REF} (V)	V_L (V)	V_H (V)	R_T (Ω)	V_T (V)	V_M (V)
Single-Ended						
GTL	0.8	$V_{REF} - 0.2$	$V_{REF} + 0.2$	25	1.2	V_{REF}

RSDS_25		-	1.3 - 0.1	1.3 + 0.1	50	1.2	1.2

Notes:

1. Descriptions of the relevant symbols are as follows:

V_{REF} -- The reference voltage for setting the input switching threshold

V_M -- Voltage of measurement point on signal transition

V_L -- Low-level test voltage at Input pin

V_H -- High-level test voltage at Input pin

R_T -- Effective termination resistance, which takes on a value of 1M Ω when no parallel termination is required

V_T -- Termination voltage

2. The load capacitance (C_L) at the Output pin is 0 pF for all signal standards.

3. According to the PCI specification.

The capacitive load (C_L) is connected between the output and GND. The Output timing for all standards, as published in the speed files and the data sheet, is always based on a C_L value of zero. High-impedance probes (less than 1 pF) are used for all measurements. Any delay that the test fixture might contribute to test measurements is subtracted from those measurements to produce the final timing numbers as published in the speed files and data sheet.

Using IBIS Models to Simulate Load Conditions in Application

IBIS Models permit the most accurate prediction of timing delays for a given application. The parameters found in the IBIS model (V_{REF} , R_{REF} , and V_{MEAS}) correspond directly with the parameters used in Table 21, V_T , R_T , and V_M . Do not confuse V_{REF} (the termination voltage) from the IBIS model with V_{REF} (the input-switching threshold) from the table. A fourth parameter, C_{REF} , is always zero. The four parameters describe all relevant output test conditions.

IBIS models are found in the Xilinx development software as well as at the following link:

http://www.xilinx.com/support/sw_ibis.htm

Simulate delays for a given application according to its specific load conditions as follows:

1. Simulate the desired signal standard with the output driver connected to the test setup shown in Figure 4. Use parameter values V_T , R_T , and V_M from Table 21. C_{REF} is zero.
2. Record the time to V_M .
3. Simulate the same signal standard with the output driver connected to the PCB trace with load. Use the appropriate IBIS model (including V_{REF} , R_{REF} , C_{REF} , and V_{MEAS} values) or capacitive value to represent the load.
4. Record the time to V_{MEAS} .
5. Compare the results of steps 2 and 4. The increase (or decrease) in delay should be added to (or subtracted from) the appropriate Output standard adjustment (Table 20) to yield the worst-case delay of the PCB trace.

Simultaneously Switching Output Guidelines

Internal Logic Timing

Table 24: CLB Timing

Symbol	Description	Speed Grade				Units
		-5		-4		
		Min	Max	Min	Max	
Clock-to-Output Times						
T _{CKO}	When reading from the FFX (FFY) Flip-Flop, the time from the active transition at the CLK input to data appearing at the XQ (YQ) output	-	0.63	-	0.72	ns
Setup Times						
T _{AS}	Time from the setup of data at the F or G input to the active transition at the CLK input of the CLB	0.46	-	0.53	-	ns
T _{DICK}	Time from the setup of data at the BX or BY input to the active transition at the CLK input of the CLB	0.18	-	0.21	-	ns
Hold Times						
T _{AH}	Time from the active transition at the CLK input to the point where data is last held at the F or G input	0	-	0	-	ns
T _{CKDI}	Time from the active transition at the CLK input to the point where data is last held at the BX or BY input	0.25	-	0.29	-	ns
Clock Timing						
T _{CH}	The High pulse width of the CLB's CLK signal	0.69	-	0.79	-	ns
T _{CL}	The Low pulse width of the CLK signal	0.69	-	0.79	-	ns
F _{TOG}	Maximum toggle frequency (for export control)	-	724	-	632	MHz
Propagation Times						
T _{ILO}	The time it takes for data to travel from the CLB's F (G) input to the X (Y) output	-	0.53	-	0.61	ns
Set/Reset Times						
T _{RPW}	The pulse width, High or Low, of the CLB's SR signal	0.66	-	0.76	-	ns

Notes:

1. The numbers in this table are based on the operating conditions set forth in [Table 5](#).
2. The timing shown is for SLICEM CLBs.

Table 25: Synchronous 18 x 18 Multiplier Timing

Symbol	Description	P Outputs	Speed Grade				Units
			-5		-4		
			Min	Max	Min	Max	
Clock-to-Output Times							
T _{MULTCK}	When reading from the Multiplier, the time from the active transition at the C clock input to data appearing at the P outputs	P[0]	-	1.00	-	1.15	ns
		P[15]	-	1.15	-	1.32	ns
		P[17]	-	1.30	-	1.50	ns
		P[19]	-	1.45	-	1.67	ns
		P[23]	-	1.76	-	2.02	ns
		P[31]	-	2.37	-	2.72	ns
		P[35]	-	2.67	-	3.07	ns
Setup Times							
T _{MULIDCK}	Time from the setup of data at the A and B inputs to the active transition at the C input of the Multiplier	-	1.84	-	2.11	-	ns
Hold Times							
T _{MULCKID}	Time from the active transition at the Multiplier's C input to the point where data is last held at the A and B inputs	-	0	-	0	-	ns

Notes:

- The numbers in this table are based on the operating conditions set forth in Table 5.

Table 26: Asynchronous 18 x 18 Multiplier Timing

Symbol	Description	P Outputs	Speed Grade		Units
			-5	-4	
			Max	Max	
Propagation Times					
T _{MULT}	The time it takes for data to travel from the A and B inputs to the P outputs	P[0]	1.55	1.78	ns
		P[15]	3.15	3.62	ns
		P[17]	3.36	3.86	ns
		P[19]	3.49	4.01	ns
		P[23]	3.73	4.29	ns
		P[31]	4.23	4.86	ns
		P[35]	4.47	5.14	ns

Notes:

- The numbers in this table are based on the operating conditions set forth in Table 5.

Table 27: Block RAM Timing

Symbol	Description	Speed Grade				Units
		-5		-4		
		Min	Max	Min	Max	
Clock-to-Output Times						
T _{BCKO}	When reading from the Block RAM, the time from the active transition at the CLK input to data appearing at the DOUT output	-	2.09	-	2.40	ns
Setup Times						
T _{BDCK}	Time from the setup of data at the DIN inputs to the active transition at the CLK input of the Block RAM	0.43	-	0.49	-	ns
Hold Times						
T _{BCKD}	Time from the active transition at the Block RAM's CLK input to the point where data is last held at the DIN inputs	0	-	0	-	ns
Clock Timing						
T _{BPWH}	The High pulse width of the Block RAM's CLK signal	1.19	-	1.37	-	ns
T _{BPWL}	The Low pulse width of the CLK signal	1.19	-	1.37	-	ns

Notes:

1. The numbers in this table are based on the operating conditions set forth in [Table 5](#).

Digital Clock Manager (DCM) Timing

For specification purposes, the DCM consists of three key components: the Delay-Locked Loop (DLL), the Digital Frequency Synthesizer (DFS), and the Phase Shifter (PS).

Aspects of DLL operation play a role in all DCM applications. All such applications inevitably use the CLKIN and the CLKFB inputs connected to either the CLK0 or the CLK2X feedback, respectively. Thus, specifications in the DLL tables (Table 28 and Table 29) apply to any application that only employs the DLL component. When the DFS and/or the PS components are used together with the DLL, then the specifications listed in the DFS and PS tables (Table 30 through Table 33) supersede any corresponding ones in the DLL tables. DLL specifications that do not change with the addition of DFS or PS functions are presented in Table 28 and Table 29.

Period jitter and cycle-cycle jitter are two (of many) different ways of characterizing clock jitter. Both specifications describe statistical variation from a mean value.

Period jitter is the worst-case deviation from the average clock period of all clock cycles in the collection of clock periods sampled (usually from 100,000 to more than a million samples for specification purposes). In a histogram of period jitter, the mean value is the clock period.

Cycle-cycle jitter is the worst-case difference in clock period between adjacent clock cycles in the collection of clock periods sampled. In a histogram of cycle-cycle jitter, the mean value is zero.

Table 28: Recommended Operating Conditions for the DLL

Symbol		Description	Device Revision	Frequency Mode/ F _{CLKIN} Range	Speed Grade				Units
					-5		-4		
					Min	Max	Min	Max	
Input Frequency Ranges									
F _{CLKIN}	CLKIN_FREQ_DLL_LF	Frequency for the CLKIN input	All	Low	24 ⁽²⁾	165 ⁽³⁾	24 ⁽²⁾	165 ⁽³⁾	MHz
	CLKIN_FREQ_DLL_HF			High	48	280 ⁽³⁾	48	280 ⁽³⁾	MHz
Input Pulse Requirements									
CLKIN_PULSE		CLKIN pulse width as a percentage of the CLKIN period	0	F _{CLKIN} ≤ 100 MHz	40%	60%	40%	60%	-
				F _{CLKIN} > 100 MHz	45%	55%	45%	55%	-
Input Clock Jitter and Delay Path Variation									
CLKIN_CYC_JITT_DLL_LF		Cycle-to-cycle jitter at the CLKIN input	All	Low	-300	+300	-300	+300	ps
CLKIN_CYC_JITT_DLL_HF				High	-150	+150	-150	+150	ps
CLKIN_PER_JITT_DLL_LF		All		-1	+1	-1	+1	ns	
CLKIN_PER_JITT_DLL_HF									
CLKFB_DELAY_VAR_EXT		Allowable variation of off-chip feedback delay from the DCM output to the CLKFB input		All	-1	+1	-1	+1	ns

Notes:

1. DLL specifications apply when any of the DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV) are in use.
2. Use of the DFS permits lower F_{CLKIN} frequencies. See Table 30.
3. To double the maximum effective F_{CLKIN} limit, set the CLKIN_DIVIDE_BY_2 attribute to TRUE.

Table 29: Switching Characteristics for the DLL

Symbol	Description	Frequency Mode / F _{CLKIN} Range	Device	Speed Grade				Units
				-5		-4		
				Min	Max	Min	Max	
Output Frequency Ranges								
CLKOUT_FREQ_1X_LF	Frequency for the CLK0, CLK90, CLK180, and CLK270 outputs	Low	All	24	165	24	165	MHz
CLKOUT_FREQ_1X_HF	Frequency for the CLK0 and CLK180 outputs	High		48	280	48	280	MHz
CLKOUT_FREQ_2X_LF ⁽³⁾	Frequency for the CLK2X and CLK2X180 outputs	Low		48	330	48	330	MHz
CLKOUT_FREQ_DV_LF	Frequency for the CLKDV output	Low		1.5	110	1.5	110	MHz
CLKOUT_FREQ_DV_HF		High		3	185	3	185	MHz
Output Clock Jitter								
CLKOUT_PER_JITT_0	Period jitter at the CLK0 output	All	All	-100	+100	-100	+100	ps
CLKOUT_PER_JITT_90	Period jitter at the CLK90 output			-150	+150	-150	+150	ps
CLKOUT_PER_JITT_180	Period jitter at the CLK180 output			-150	+150	-150	+150	ps
CLKOUT_PER_JITT_270	Period jitter at the CLK270 output			-150	+150	-150	+150	ps
CLKOUT_PER_JITT_2X	Period jitter at the CLK2X and CLK2X180 outputs			-200	+200	-200	+200	ps
CLKOUT_PER_JITT_DV1	Period jitter at the CLKDV output when performing integer division			-150	+150	-150	+150	ps
CLKOUT_PER_JITT_DV2	Period jitter at the CLKDV output when performing non-integer division			-300	+300	-300	+300	ps
Duty Cycle								
CLKOUT_DUTY_CYCLE_DLL ⁽⁴⁾	Duty cycle variation for the CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV outputs	All	XC3S50	-150	+150	-150	+150	ps
			XC3S200	-150	+150	-150	+150	ps
			XC3S400	-250	+250	-250	+250	ps
			XC3S1000	-400	+400	-400	+400	ps
			XC3S1500	-400	+400	-400	+400	ps
			XC3S2000					ps
			XC3S4000					ps
			XC3S5000					ps
Phase Alignment								
CLKIN_CLKFB_PHASE	Phase offset between the CLKIN and CLKFB inputs	All	All	-150	+150	-150	+150	ps
CLKOUT_PHASE	Phase offset between any DLL output except CLK2X and CLK0			-140	+140	-140	+140	ps
	Phase offset between CLK2X and CLK0			-250	+250	-250	+250	ps

Table 29: Switching Characteristics for the DLL (Continued)

Symbol	Description	Frequency Mode / F _{CLKIN} Range	Device	Speed Grade				Units
				-5		-4		
				Min	Max	Min	Max	
Lock Time								
LOCK_DLL	When using the DLL alone: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase	24 MHz ≤ F _{CLKIN} ≤ 30 MHz	All	-	2.88	-	2.88	ms
		30 MHz < F _{CLKIN} ≤ 40 MHz		-	2.16	-	2.16	ms
		40 MHz < F _{CLKIN} ≤ 50 MHz		-	1.20	-	1.20	ms
		50 MHz < F _{CLKIN} ≤ 60 MHz		-	0.60	-	0.60	ms
		F _{CLKIN} > 60 MHz		-	0.48	-	0.48	ms
Delay Lines								
DCM_TAP	Delay tap resolution	All	All	30.0	60.0	30.0	60.0	ps

Notes:

- The numbers in this table are based on the operating conditions set forth in Table 5 and Table 28.
- DLL specifications apply when any of the DLL outputs (CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, or CLKDV) are in use.
- For all Spartan-3 devices except the XC3S50 and the XC3S1000, use feedback from the CLK0 output (instead of the CLK2X output) and set the *CLK_FEEDBACK* attribute to 1X.
- This specification only applies if the attribute *DUTY_CYCLE_CORRECTION* = TRUE.

Table 30: Recommended Operating Conditions for the DFS

Symbol		Description	Frequency Mode	Speed Grade				Units
				-5		-4		
				Min	Max	Min	Max	
Input Frequency Ranges ⁽²⁾								
F _{CLKIN}	CLKIN_FREQ_FX_LF	Frequency for the CLKIN input	Low	1	210	1	210	MHz
	CLKIN_FREQ_FX_HF		High	48	280	48	280	MHz
Input Clock Jitter								
CLKIN_CYC_JITT_FX_LF		Cycle-to-cycle jitter at the CLKIN input	Low	-300	+300	-300	+300	ps
CLKIN_CYC_JITT_FX_HF			High	-150	+150	-150	+150	ps
CLKIN_PER_JITT_FX_LF		Period jitter at the CLKIN input	All	-1	+1	-1	+1	ns
CLKIN_PER_JITT_FX_HF								

Notes:

- DFS specifications apply when either of the DFS outputs (CLKFX or CLKFX180) are in use.
- If both DFS and DLL outputs are used on the same DCM, follow the more restrictive CLKIN_FREQ_DLL specifications in Table 28.

Table 31: Switching Characteristics for the DFS

Symbol	Description	Frequency Mode	Device	Speed Grade				Units	
				-5		-4			
				Min	Max	Min	Max		
Output Frequency Ranges									
CLKOUT_FREQ_FX_LF	Frequency for the CLKFX and CLKFX180 outputs	Low	All	24	210	24	210	MHz	
CLKOUT_FREQ_FX_HF		High		210	280	210	280	MHz	
Output Clock Jitter									
CLKOUT_PER_JITT_FX	Period jitter at the CLKFX and CLKFX180 outputs	All	All	Note 3	Note 3	Note 3	Note 3	ps	
Duty Cycle ⁽⁴⁾									
CLKOUT_DUTY_CYCLE_FX	Duty cycle precision for the CLKFX and CLKFX180 outputs	All	XC3S50	-100	+100	-100	+100	ps	
			XC3S200	-100	+100	-100	+100	ps	
			XC3S400	-250	+250	-250	+250	ps	
			XC3S1000	-400	+400	-400	+400	ps	
			XC3S1500	-400	+400	-400	+400	ps	
			XC3S2000					ps	
			XC3S4000					ps	
			XC3S5000					ps	
Phase Alignment									
CLKOUT_PHASE	Phase offset between either DFS output and CLK0	All	All	-300	+300	-300	+300	ps	
Lock Time									
LOCK_DLL_FX	When using the DFS in conjunction with the DLL: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase.	All	All	-	10.0	-	10.0	ms	
LOCK_FX	When using the DFS without the DLL: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. By asserting the LOCKED signal, the DFS indicates valid CLKFX and CLKFX180 signals.	All	All	-	10.0	-	10.0	ms	

Notes:

- The numbers in this table are based on the operating conditions set forth in Table 5 and Table 30.
- DFS specifications apply when either of the DFS outputs (CLKFX or CLKFX180) is in use.
- Use the Virtex-II™ Jitter Calculator at http://www.xilinx.com/applications/web_ds_v2/jitter_calc.htm.
- The CLKFX and CLKFX180 outputs always approximate 50% duty cycles.

Phase Shifter (PS)

Phase Shifter operation is only supported in the Low frequency mode. For Rev. 0 devices, the Variable Phase mode

only permits positive shifts. For any desired negative phase shift ($-S$), an equivalent positive phase shift ($360^\circ - S$) is possible.

Table 32: Recommended Operating Conditions for the PS in Variable Phase Mode

Symbol	Description	Device Revision	Frequency Mode/ F _{CLKIN} Range		Speed Grade				Units
					-5		-4		
					Min	Max	Min	Max	
Operating Frequency Ranges									
PSCLK_FREQ (F _{PSCLK})	Frequency for the PSCLK input	All	Low		1	165	1	165	MHz
Input Pulse Requirements									
PSCLK_PULSE	PSCLK pulse width as a percentage of the PSCLK period	0	Low	F _{CLKIN} ≤ 100 MHz	40%	60%	40%	60%	-
				F _{CLKIN} > 100 MHz	45%	55%	45%	55%	-

Notes:

- The PS specifications in this table apply when the PS attribute CLKOUT_PHASE_SHIFT= VARIABLE.

Table 33: Switching Characteristics for the PS in Variable Phase Mode

Symbol	Description	Frequency Mode/ F _{CLKIN} Range	Speed Grade				Units
			-5		-4		
			Min	Max	Min	Max	
Phase Shifting Range							
FINE_SHIFT_RANGE	Range for variable phase shifting	Low	-	10.0	-	10.0	ns
Lock Time							
LOCK_DLL_PS	When using the PS in conjunction with the DLL: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase.	24 MHz ≤ F _{CLKIN} ≤ 30 MHz	-	3.28	-	3.28	ms
		30 MHz < F _{CLKIN} ≤ 40 MHz	-	2.56	-	2.56	ms
		40 MHz < F _{CLKIN} ≤ 50 MHz	-	1.60	-	1.60	ms
		50 MHz < F _{CLKIN} ≤ 60 MHz	-	1.00	-	1.00	ms
		60 MHz < F _{CLKIN} ≤ 165 MHz	-	0.88	-	0.88	ms
LOCK_DLL_PS_FX	When using the PS in conjunction with the DLL and DFS: The time from deassertion at the DCM's Reset input to the rising transition at its LOCKED output. When the DCM is locked, the CLKIN and CLKFB signals are in phase.	Low	-	10.40	-	10.40	ms

Notes:

- The numbers in this table are based on the operating conditions set forth in Table 5 and Table 32.
- The PS specifications in this table apply when the PS attribute CLKOUT_PHASE_SHIFT= VARIABLE.

Configuration and JTAG Timing

Notes:

1. The V_{CCINT} , V_{CCAUX} , and V_{CCO} supplies may be applied in any order.
2. The Low-going pulse on PROG_B is optional after power-on but necessary for reconfiguration without a power cycle.
3. The rising edge of INIT_B samples the voltage levels applied to the mode pins (M0 - M2).

Figure 5: Waveforms for Power-On and the Beginning of Configuration

Table 34: Power-On Timing and the Beginning of Configuration

Symbol	Description	Device	All Speed Grades		Units
			Min	Max	
$T_{POR}^{(2)}$	The time from the application of V_{CCINT} , V_{CCAUX} , and V_{CCO} Bank 4 supply voltage ramps (whichever occurs last) to the rising transition of the INIT_B pin	XC3S50	-	5	ms
		XC3S200	-	5	ms
		XC3S400	-	5	ms
		XC3S1000	-	5	ms
		XC3S1500	-	7	ms
		XC3S2000	-	7	ms
		XC3S4000	-	7	ms
		XC3S5000	-	7	ms
T_{PROG}	The width of the low-going pulse on the PROG_B pin	All	0.3	-	μ s
$T_{PL}^{(2)}$	The time from the rising edge of the PROG_B pin to the rising transition on the INIT_B pin	XC3S50	-	2	ms
		XC3S200	-	2	ms
		XC3S400	-	2	ms
		XC3S1000	-	2	ms
		XC3S1500	-	3	ms
		XC3S2000	-	3	ms
		XC3S4000	-	3	ms
		XC3S5000	-	3	ms
$T_{ICCK}^{(3)}$	The time from the rising edge of the INIT_B pin to the generation of the configuration clock signal at the CCLK output pin	All	0.5	4.0	μ s

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 5. This means power must be applied to all V_{CCINT} , V_{CCO} , and V_{CCAUX} lines.
2. Power-on reset and the clearing of configuration memory occurs during this period.
3. This specification applies only for the Master Serial and Master Parallel modes.

DS099-3_04_071604

Figure 6: Waveforms for Master and Slave Serial Configuration

Table 35: Timing for the Master and Slave Serial Configuration Modes

Symbol	Description	Slave/Master	All Speed Grades		Units
			Min	Max	
Clock-to-Output Times					
T _{CCO}	The time from the rising transition on the CCLK pin to data appearing at the DOUT pin	Both	1.5	12.0	ns
Setup Times					
T _{DCC}	The time from the setup of data at the DIN pin to the rising transition at the CCLK pin	Both	10.0	-	ns
Hold Times					
T _{CCD}	The time from the rising transition at the CCLK pin to the point when data is last held at the DIN pin	Both	0	-	ns
Clock Timing					
T _{CCH}	The High pulse width at the CCLK input pin	Slave	5.0	-	ns
T _{CCL}	The Low pulse width at the CCLK input pin		5.0	-	ns
F _{CCSER}	Frequency of the clock signal at the CCLK input pin		-	50 ⁽²⁾	MHz
ΔF _{CCSER}	Variation from the CCLK output frequency set using the ConfigRate BitGen option	Master	−50%	+50%	-

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 5.
2. For serial configuration with a daisy-chain of multiple FPGAs, the maximum limit is 45 MHz.

DS099-3_05_041103

Notes:

1. Switching RDWR_B High or Low while holding CS_B Low asynchronously aborts configuration.

Figure 7: Waveforms for Master and Slave Parallel Configuration

Table 36: Timing for the Master and Slave Parallel Configuration Modes

Symbol	Description	Slave/Master	All Speed Grades		Units
			Min	Max	
Clock-to-Output Times					
T _{SMCKBY}	The time from the rising transition on the CCLK pin to a signal transition at the BUSY pin	Slave	-	12.0	ns
Setup Times					
T _{SMDCC}	The time from the setup of data at the D0-D7 pins to the rising transition at the CCLK pin	Both	10.0	-	ns
T _{SMCSCC}	The time from the setup of a logic level at the CS_B pin to the rising transition at the CCLK pin		10.0	-	ns
T _{SMCCW} ⁽²⁾	The time from the setup of a logic level at the RDWR_B pin to the rising transition at the CCLK pin		10.0	-	ns

Table 36: Timing for the Master and Slave Parallel Configuration Modes (Continued)

Symbol	Description		Slave/Master	All Speed Grades		Units
				Min	Max	
Hold Times						
T _{SMCCD}	The time from the rising transition at the CCLK pin to the point when data is last held at the D0-D7 pins		Both	0	-	ns
T _{SMCCCS}	The time from the rising transition at the CCLK pin to the point when a logic level is last held at the CS_B pin			0	-	ns
T _{SMWCC} ⁽²⁾	The time from the rising transition at the CCLK pin to the point when a logic level is last held at the RDWR_B pin			0	-	ns
Clock Timing						
T _{CCH}	The High pulse width at the CCLK input pin		Slave	5	-	ns
T _{CCL}	The Low pulse width at the CCLK input pin			5	-	ns
F _{CCPAR}	Frequency of the clock signal at the CCLK input pin	Not using the BUSY pin ⁽³⁾		-	50	MHz
		Using the BUSY pin		-	66	MHz
ΔF _{CCPAR}	Variation from the CCLK output frequency set using the BitGen option ConfigRate		Master	−50%	+50%	-

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 5.
2. RDWR_B is synchronized to CCLK for the purpose of performing the Abort operation. The same pin asynchronously controls the driver impedance of the D0 - D7 pins. To avoid contention when writing configuration data to the D0 - D7 bus, do not bring RDWR_B High when CS_B is Low.
3. In the Slave Parallel mode, it is necessary to use the BUSY pin when the CCLK frequency exceeds this maximum specification.
4. Some Xilinx documents may refer to Parallel modes as "SelectMAP" modes.

DS099_06_040703

Notes:

1. The numbers in this table are based on the operating conditions set forth in Table 5.

Revision History

Date	Version No.	Description
04/11/03	1.0	Initial Xilinx release.
07/11/03	1.1	Extended Absolute Maximum Rating for junction temperature in Table 1 . Added numbers for typical quiescent supply current (Table 7) and DLL timing.
02/06/04	1.2	Revised V_{IN} maximum rating (Table 1). Added power-on requirements (Table 3), leakage current number (Table 6), and differential output voltage levels (Table 11) for Rev. 0. Published new quiescent current numbers (Table 7). Updated pull-up and pull-down resistor strengths (Table 6). Added LVDCI_DV2 and LVPECL standards (Table 10 and Table 11). Changed CCLK setup time (Table 35 and Table 36).
03/04/04	1.3	Added timing numbers from v1.29 speed files as well as DCM timing (Table 28 through Table 33).
08/24/04	1.4	Added reference to errata documents on page 1 . Clarified Absolute Maximum Ratings and added ESD information (Table 1). Explained V_{CCO} ramp time measurement (Table 3). Clarified I_L specification (Table 6). Updated quiescent current numbers and added information on power-on and surplus current (Table 7). Adjusted V_{REF} range for HSTL_III and HSTL_I_18 and changed V_{IH} min for LVCMOS12 (Table 8). Added note limiting V_{TT} range for SSTL2_II signal standards (Table 9). Calculated V_{OH} and V_{OL} levels for differential standards (Table 11). Updated Switching Characteristics with speed file v1.32 (Table 13 through Table 21 and Table 24 through Table 27). Corrected IOB test conditions (Table 14). Updated DCM timing with latest characterization data (Table 28 through Table 32). Improved DCM CLKIN pulse width specification (Table 28). Recommended use of Virtex-II Jitter calculator (Table 31). Improved DCM PSCLK pulse width specification (Table 32). Changed Phase Shifter lock time parameter (Table 33). Because the BitGen option <i>Centered_x#_y#</i> is not necessary for Variable Phase Shift mode, removed BitGen command table and referring text. Adjusted maximum CCLK frequency for the slave serial and parallel configuration modes (Table 35). Inverted CCLK waveform (Figure 6). Adjusted JTAG setup times (Table 37).

The Spartan-3 Family Data Sheet

DS099-1, *Spartan-3 FPGA Family: **Introduction and Ordering Information*** (Module 1)

DS099-2, *Spartan-3 FPGA Family: **Functional Description*** (Module 2)

DS099-3, *Spartan-3 FPGA Family: **DC and Switching Characteristics*** (Module 3)

DS099-4, *Spartan-3 FPGA Family: **Pinout Descriptions*** (Module 4)

Introduction

This data sheet module describes the various pins on a Spartan™-3 FPGA and how they connect to the supported component packages.

- The **Pin Types** section categorizes all of the FPGA pins by their function type.
- The **Pin Definitions** section provides a top-level description for each pin on the device.
- The **Detailed, Functional Pin Descriptions** section offers significantly more detail about each pin, especially for the dual- or special-function pins used during device configuration.
- Some pins have associated optional behavior, controlled by settings in the configuration bitstream. These options are described in the **Bitstream Options** section.

- The **Package Overview** section describes the various packaging options available for Spartan-3 FPGAs. Detailed pin list tables and footprint diagrams are provided for each package solution.

Pin Descriptions

Pin Types

A majority of the pins on a Spartan-3 FPGA are general-purpose, user-defined I/O pins. There are, however, up to 12 different functional types of pins on Spartan-3 packages, as outlined in **Table 1**. In the package footprint drawings that follow, the individual pins are color-coded according to pin type as in the table.

Table 1: Types of Pins on Spartan-3 FPGAs

Type/ Color Code	Description	Pin Name(s) in Type
I/O	Unrestricted, general-purpose user-I/O pin. Most pins can be paired together to form differential I/Os.	IO, IO_Lxxy_#
DUAL	Dual-purpose pin used in some configuration modes during the configuration process and then usually available as a user I/O after configuration. If the pin is not used during configuration, this pin behaves as an I/O-type pin. There are 12 dual-purpose configuration pins on every package.	IO_Lxxy_#/DIN/D0, IO_Lxxy_#/D1, IO_Lxxy_#/D2, IO_Lxxy_#/D3, IO_Lxxy_#/D4, IO_Lxxy_#/D5, IO_Lxxy_#/D6, IO_Lxxy_#/D7, IO_Lxxy_#/CS_B, IO_Lxxy_#/RDWR_B, IO_Lxxy_#/BUSY/DOUT, IO_Lxxy_#/INIT_B
CONFIG	Dedicated configuration pin. Not available as a user-I/O pin. Every package has seven dedicated configuration pins. These pins are powered by VCCAUX.	CCLK, DONE, M2, M1, M0, PROG_B, HSWAP_EN
JTAG	Dedicated JTAG pin. Not available as a user-I/O pin. Every package has four dedicated JTAG pins. These pins are powered by VCCAUX.	TDI, TMS, TCK, TDO
DCI	Dual-purpose pin that is either a user-I/O pin or used to calibrate output buffer impedance for a specific bank using Digital Controlled Impedance (DCI). There are two DCI pins per I/O bank.	IO/VRN_# IO_Lxxy_#/VRN_# IO/VRP_# IO_Lxxy_#/VRP_#
VREF	Dual-purpose pin that is either a user-I/O pin or, along with all other VREF pins in the same bank, provides a reference voltage input for certain I/O standards. If used for a reference voltage within a bank, all VREF pins within the bank must be connected.	IO/VREF_# IO_Lxxy_#/VREF_#

Table 1: Types of Pins on Spartan-3 FPGAs (Continued)

Type/ Color Code	Description	Pin Name(s) in Type
GND	Dedicated ground pin. The number of GND pins depends on the package used. All must be connected.	GND
VCCAUX	Dedicated auxiliary power supply pin. The number of VCCAUX pins depends on the package used. All must be connected to +2.5V.	VCCAUX
VCCINT	Dedicated internal core logic power supply pin. The number of VCCINT pins depends on the package used. All must be connected to +1.2V.	VCCINT
VCCO	Dedicated I/O bank, output buffer power supply pin. Along with other VCCO pins in the same bank, this pin supplies power to the output buffers within the I/O bank and sets the input threshold voltage for some I/O standards.	VCCO_# TQ144 Package Only: VCCO_LEFT, VCCO_TOP, VCCO_RIGHT, VCCO_BOTTOM
GCLK	Dual-purpose pin that is either a user-I/O pin or an input to a specific global buffer input. Every package has eight dedicated GCLK pins.	IO_Lxxy_#/GCLK0, IO_Lxxy_#/GCLK1, IO_Lxxy_#/GCLK2, IO_Lxxy_#/GCLK3, IO_Lxxy_#/GCLK4, IO_Lxxy_#/GCLK5, IO_Lxxy_#/GCLK6, IO_Lxxy_#/GCLK7
N.C.	This package pin is not connected in this specific device/package combination but may be connected in larger devices in the same package.	N.C.

Notes:

1. # = I/O bank number, an integer between 0 and 7.

I/Os with Lxxy_# are part of a differential output pair. 'L' indicates differential output capability. The "xx" field is a two-digit integer, unique to each bank that identifies a differential pin-pair. The 'y' field is either 'P' for the true signal or 'N' for the inverted signal in the differential pair. The '#' field is the I/O bank number.

Pin Definitions

Table 2 provides a brief description of each pin listed in the Spartan-3 pinout tables and package footprint diagrams. Pins are categorized by their pin type, as listed in Table 1. See **Detailed, Functional Pin Descriptions** for more information.

Table 2: Spartan-3 Pin Definitions

Pin Name	Direction	Description
I/O: General-purpose I/O pins		
I/O	User-defined as input, output, bidirectional, three-state output, open-drain output, open-source output	User I/O: Unrestricted single-ended user-I/O pin. Supports all I/O standards except the differential standards.
I/O_Lxxy_#	User-defined as input, output, bidirectional, three-state output, open-drain output, open-source output	User I/O, Half of Differential Pair: Unrestricted single-ended user-I/O pin or half of a differential pair. Supports all I/O standards including the differential standards.
DUAL: Dual-purpose configuration pins		
IO_Lxxy_#/DIN/D0, IO_Lxxy_#/D1, IO_Lxxy_#/D2, IO_Lxxy_#/D3, IO_Lxxy_#/D4, IO_Lxxy_#/D5, IO_Lxxy_#/D6, IO_Lxxy_#/D7	Input during configuration Possible bidirectional I/O after configuration if SelectMap port is retained. Otherwise, user I/O after configuration	Configuration Data Port: In Parallel (SelectMAP) modes, D0-D7 are byte-wide configuration data pins. These pins become user I/Os after configuration unless the SelectMAP port is retained via the Persist bitstream option. In Serial modes, DIN (D0) serves as the single configuration data input. This pin becomes a user I/O after configuration unless retained by the Persist bitstream option.
IO_Lxxy_#/CS_B	Input during Parallel mode configuration Possible input after configuration if SelectMap port is retained. Otherwise, user I/O after configuration	Chip Select for Parallel Mode Configuration: In Parallel (SelectMAP) modes, this is the active-Low Chip Select signal. This pin becomes a user I/O after configuration unless the SelectMAP port is retained via the Persist bitstream option.
IO_Lxxy_#/RDWR_B	Input during Parallel mode configuration Possible input after configuration if SelectMap port is retained. Otherwise, user I/O after configuration	Read/Write Control for Parallel Mode Configuration: In Parallel (SelectMAP) modes, this is the active-Low Write Enable, active-High Read Enable signal. This pin becomes a user I/O after configuration unless the SelectMAP port is retained via the Persist bitstream option.
IO_Lxxy_#/BUSY/DOUT	Output during configuration Possible output after configuration if SelectMap port is retained. Otherwise, user I/O after configuration	Configuration Data Rate Control for Parallel Mode, Serial Data Output for Serial Mode: In Parallel (SelectMAP) modes, BUSY throttles the rate at which configuration data is loaded. This pin becomes a user I/O after configuration unless the SelectMAP port is retained via the Persist bitstream option. In Serial modes, DOUT provides preamble and configuration data to downstream devices in a multi-FPGA daisy-chain. This pin becomes a user I/O after configuration.

Table 2: Spartan-3 Pin Definitions (Continued)

Pin Name	Direction	Description
IO_Lxxy_#/INIT_B	Bidirectional (open-drain) during configuration User I/O after configuration	Initializing Configuration Memory/Detected Configuration Error: When Low, this pin indicates that configuration memory is being cleared. When held Low, this pin delays the start of configuration. After this pin is released or configuration memory is cleared, the pin goes High. During configuration, a Low on this output indicates that a configuration data error occurred. This pin becomes a user I/O after configuration.
DCI: Digitally Controlled Impedance reference resistor input pins		
IO_Lxxy_#/VRN_# or IO/VRN_#	Input when using DCI Otherwise, same as I/O	DCI Reference Resistor for NMOS I/O Transistor (per bank): If using DCI, a 1% precision impedance-matching resistor is connected between this pin and the VCCO supply for this bank. Otherwise, this pin is a user I/O.
IO_Lxxy_#/VRP_# or IO/VRP_#	Input when using DCI Otherwise, same as I/O	DCI Reference Resistor for PMOS I/O Transistor (per bank): If using DCI, a 1% precision impedance-matching resistor is connected between this pin and the ground supply. Otherwise, this pin is a user I/O.
GCLK: Global clock buffer inputs		
IO_Lxxy_#/GCLK0, IO_Lxxy_#/GCLK1, IO_Lxxy_#/GCLK2, IO_Lxxy_#/GCLK3, IO_Lxxy_#/GCLK4, IO_Lxxy_#/GCLK5, IO_Lxxy_#/GCLK6, IO_Lxxy_#/GCLK7	Input if connected to global clock buffers Otherwise, same as I/O	Global Buffer Input: Direct input to a low-skew global clock buffer. If not connected to a global clock buffer, this pin is a user I/O.
VREF: I/O bank input reference voltage pins		
IO_Lxxy_#/VREF_# or IO/VREF_#	Voltage supply input when VREF pins are used within a bank. Otherwise, same as I/O	Input Buffer Reference Voltage for Special I/O Standards (per bank): If required to support special I/O standards, all the VREF pins within a bank connect to a input threshold voltage source. If not used as input reference voltage pins, these pins are available as individual user-I/O pins.
CONFIG: Dedicated configuration pins		
CCLK	Input in Slave configuration modes Output in Master configuration modes	Configuration Clock: The configuration clock signal synchronizes configuration data.
PROG_B	Input	Program/Configure Device: Active Low asynchronous reset to configuration logic. Asserting PROG_B Low for an extended period delays the configuration process. This pin has an internal weak pull-up resistor during configuration.

Table 2: Spartan-3 Pin Definitions (Continued)

Pin Name	Direction	Description
DONE	Bidirectional with open-drain or totem-pole Output	Configuration Done, Delay Start-up Sequence: A Low-to-High output transition on this bidirectional pin signals the end of the configuration process. The FPGA produces a Low-to-High transition on this pin to indicate that the configuration process is complete. The DriveDone bitstream generation option defines whether this pin functions as a totem-pole output that actively drives High or as an open-drain output. An open-drain output requires a pull-up resistor to produce a High logic level. The open-drain option permits the DONE lines of multiple FPGAs to be tied together, so that the common node transitions High only after all of the FPGAs have completed configuration. Externally holding the open-drain output Low delays the start-up sequence, which marks the transition to user mode.
M0, M1, M2	Input	Configuration Mode Selection: These inputs select the configuration mode. The logic levels applied to the mode pins are sampled on the rising edge of INIT_B. See Table 7.
HSWAP_EN	Input	Disable Weak Pull-up Resistors During Configuration: A Low on this pin enables weak pull-up resistors on all pins that are not actively involved in the configuration process. A High value disables all pull-ups, allowing the non-configuration pins to float.
JTAG: JTAG interface pins		
TCK	Input	JTAG Test Clock: The TCK clock signal synchronizes all JTAG port operations.
TDI	Input	JTAG Test Data Input: TDI is the serial data input for all JTAG instruction and data registers.
TMS	Input	JTAG Test Mode Select: The serial TMS input controls the operation of the JTAG port.
TDO	Output	JTAG Test Data Output: TDO is the serial data output for all JTAG instruction and data registers.
VCCO: I/O bank output voltage supply pins		
VCCO_#	Supply	Power Supply for Output Buffer Drivers (per bank): These pins power the output drivers within a specific I/O bank.
VCCAUX: Auxiliary voltage supply pins		
VCCAUX	Supply	Power Supply for Auxiliary Circuits: +2.5V power pins for auxiliary circuits, including the Digital Clock Managers (DCMs), the dedicated configuration pins (CONFIG), and the dedicated JTAG pins. All VCCAUX pins must be connected.
VCCINT: Internal core voltage supply pins		
VCCINT	Supply	Power Supply for Internal Core Logic: +1.2V power pins for the internal logic. All pins must be connected.

Table 2: Spartan-3 Pin Definitions (Continued)

Pin Name	Direction	Description
GND: Ground supply pins		
GND	Supply	Ground: Ground pins, which are connected to the power supply's return path. All pins must be connected.
N.C.: Unconnected package pins		
N.C.		Unconnected Package Pin: These package pins are unconnected.

Notes:

1. All unused inputs and bidirectional pins must be tied either High or Low. For unused enable inputs, apply the level that disables the associated function. One common approach is to activate internal pull-up or pull-down resistors. An alternative approach is to externally connect the pin to either VCCO or GND.
2. All outputs are of the totem-pole type — i.e., they can drive High as well as Low logic levels — except for the cases where “Open Drain” is indicated. The latter can only drive a Low logic level and require a pull-up resistor to produce a High logic level.

Detailed, Functional Pin Descriptions

I/O Type: Unrestricted, General-purpose I/O Pins

After configuration, I/O-type pins are inputs, outputs, bidirectional I/O, three-state outputs, open-drain outputs, or open-source outputs, as defined in the application

Pins labeled “IO” support all SelectIO™ signal standards except differential standards. A given device at most only has a few of these pins.

A majority of the general-purpose I/O pins are labeled in the format “IO_Lxxy_#”. These pins support all SelectIO signal standards, including the differential standards such as LVDS, ULVDS, BLVDS, RSDS, or LDT.

For additional information, see the “IOBs” section in Module 2: **Functional Description**.

Differential Pair Labeling

A pin supports differential standards if the pin is labeled in the format “Lxxy_#”. The pin name suffix has the following significance. **Figure 1** provides a specific example showing a differential input to and a differential output from Bank 2.

- ‘L’ indicates differential capability.
- “xx” is a two-digit integer, unique for each bank, that identifies a differential pin-pair.
- ‘y’ is replaced by ‘P’ for the true signal or ‘N’ for the inverted. These two pins form one differential pin-pair.
- ‘#’ is an integer, 0 through 7, indicating the associated I/O bank.

If unused, these pins are in a high impedance state. The Bit-stream generator option UnusedPin enables a weak pull-up or pull-down resistor on all unused I/O pins.

Behavior from Power-On through End of Configuration

During the configuration process, all pins that are not actively involved in the configuration process are in a high-impedance state. The HSWAP_EN input determines whether or not weak pull-up resistors are enabled during configuration. HSWAP_EN = 0 enables the weak pull-up resistors. HSWAP_EN = 1 disables the pull-up resistors allowing the pins to float, which is the desired state for hot-swap applications.

DS099-4_01_042303

Figure 1: Differential Pair Labelling

DUAL Type: Dual-Purpose Configuration and I/O Pins

These pins serve dual purposes. The user-I/O pins are temporarily borrowed during the configuration process to load configuration data into the FPGA. After configuration, these pins are then usually available as a user I/O in the application. If a pin is not applicable to the specific configuration mode—controlled by the mode select pins M2, M1, and M0—then the pin behaves as an I/O-type pin.

There are 12 dual-purpose configuration pins on every package, six of which are part of I/O Bank 4, the other six part of I/O Bank 5. Only a few of the pins in Bank 4 are used in the Serial configuration modes.

See "**Configuration**" in Module 2: **Functional Description**.

See "**Pin Behavior During Configuration**, page 15".

Serial Configuration Modes

This section describes the dual-purpose pins used during either Master or Slave Serial mode. See [Table 7](#) for Mode Select pin settings required for Serial modes. All such pins are in Bank 4 and powered by VCCO_4.

In both the Master and Slave Serial modes, DIN is the serial configuration data input. The D1-D7 inputs are unused in serial mode and behave like general-purpose I/O pins.

In all the cases, the configuration data is synchronized to the rising edge of the CCLK clock signal.

The DIN, DOUT, and INIT_B pins can be retained in the application to support reconfiguration by setting the Persist bitstream generation option. However, the serial modes do not support device readback.

Table 3: Dual-Purpose Pins Used in Master or Slave Serial Mode

Pin Name	Direction	Description
DIN	Input	Serial Data Input: During the Master or Slave Serial configuration modes, DIN is the serial configuration data input, and all data is synchronized to the rising CCLK edge. After configuration, this pin is available as a user I/O. This signal is located in Bank 4 and its output voltage determined by VCCO_4. The BitGen option Persist permits this pin to retain its configuration function in the User mode.
DOUT	Output	Serial Data Output: In a multi-FPGA design where all the FPGAs use serial mode, connect the DOUT output of one FPGA—in either Master or Slave Serial mode—to the DIN input of the next FPGA—in Slave Serial mode—so that configuration data passes from one to the next, in daisy-chain fashion. This “daisy chain” permits sequential configuration of multiple FPGAs. This signal is located in Bank 4 and its output voltage determined by VCCO_4. The BitGen option Persist permits this pin to retain its configuration function in the User mode.
INIT_B	Bidirectional (open-drain)	Initializing Configuration Memory/Configuration Error: Just after power is applied, the FPGA produces a Low-to-High transition on this pin indicating that initialization (<i>i.e.</i>, clearing) of the configuration memory has finished. Before entering the User mode, this pin functions as an open-drain output, which requires a pull-up resistor in order to produce a High logic level. In a multi-FPGA design, tie (wire AND) the INIT_B pins from all FPGAs together so that the common node transitions High only after all of the FPGAs have been successfully initialized. Externally holding this pin Low beyond the initialization phase delays the start of configuration. This action stalls the FPGA at the configuration step just before the mode select pins are sampled. During configuration, the FPGA indicates the occurrence of a data (<i>i.e.</i>, CRC) error by asserting INIT_B Low. This signal is located in Bank 4 and its output voltage determined by VCCO_4. The BitGen option Persist permits this pin to retain its configuration function in the User mode.

Configuration Data Byte	I/O Bank 4 (VCCO_4)				I/O Bank 5 (VCCO_5)			
	High Nibble				Low Nibble			
	D0	D1	D2	D3	D4	D5	D6	D7
0xA5 =	1	0	1	0	0	1	0	1

Figure 2: Configuration Data Byte Mapping to D0-D7 Bits

Parallel Configuration Modes (SelectMAP)

This section describes the dual-purpose configuration pins used during the Master and Slave Parallel configuration modes, sometimes also called the SelectMAP modes. In both Master and Slave Parallel configuration modes, D0-D7 form the byte-wide configuration data input. See Table 7 for Mode Select pin settings required for Parallel modes.

As shown in Figure 2, D0 is the most-significant bit while D7 is the least-significant bit. Bits D0-D3 form the high nibble of the byte and bits D4-D7 form the low nibble.

In the Parallel configuration modes, both the VCCO_4 and VCCO_5 voltage supplies are required and must both equal the voltage of the attached configuration device, typically either 2.5V or 3.3V.

Assert Low both the chip-select pin, CS_B, and the read/write control pin, RDWR_B, to write the configuration data byte presented on the D0-D7 pins to the FPGA on a rising-edge of the configuration clock, CCLK. The order of

CS_B and RDWR_B does not matter, although RDWR_B must be asserted throughout the configuration process. If RDWR_B is de-asserted during configuration, the FPGA aborts the configuration operation.

After configuration, these pins are available as general-purpose user I/O. However, the SelectMAP configuration interface is optionally available for debugging and dynamic reconfiguration. To use these SelectMAP pins after configuration, set the Persist bitstream generation option.

The Readback debugging option, for example, requires the Persist bitstream generation option. During Readback mode, assert CS_B Low, along with RDWR_B High, to read a configuration data byte from the FPGA to the D0-D7 bus on a rising CCLK edge. During Readback mode, D0-D7 are output pins.

In all the cases, the configuration data and control signals are synchronized to the rising edge of the CCLK clock signal.

Table 4: Dual-Purpose Configuration Pins for Parallel (SelectMAP) Configuration Modes

Pin Name	Direction	Description						
D0, D1, D2, D3	Input during configuration Output during readback	Configuration Data Port (high nibble): Collectively, the D0-D7 pins are the byte-wide configuration data port for the Parallel (SelectMAP) configuration modes. Configuration data is synchronized to the rising edge of CCLK clock signal. The D0-D3 pins are the high nibble of the configuration data byte and located in Bank 4 and powered by VCCO_4. The BitGen option Persist permits this pin to retain its configuration function in the User mode.						
D4, D5, D6, D7	Input during configuration Output during readback	Configuration Data Port (low nibble): The D4-D7 pins are the low nibble of the configuration data byte. However, these signals are located in Bank 5 and powered by VCCO_5. The BitGen option Persist permits this pin to retain its configuration function in the User mode.						
CS_B	Input	Chip Select for Parallel Mode Configuration: Assert this pin Low, together with RDWR_B to write a configuration data byte from the D0-D7 bus to the FPGA on a rising CCLK edge. During Readback, assert this pin Low, along with RDWR_B High, to read a configuration data byte from the FPGA to the D0-D7 bus on a rising CCLK edge. This signal is located in Bank 5 and powered by VCCO_5. The BitGen option Persist permits this pin to retain its configuration function in the User mode. <table><tr><th>CS_B</th><th>Function</th></tr><tr><td>0</td><td>FPGA selected. SelectMAP inputs are valid on the next rising edge of CCLK.</td></tr><tr><td>1</td><td>FPGA deselected. All SelectMAP inputs are ignored.</td></tr></table>	CS_B	Function	0	FPGA selected. SelectMAP inputs are valid on the next rising edge of CCLK.	1	FPGA deselected. All SelectMAP inputs are ignored.
CS_B	Function							
0	FPGA selected. SelectMAP inputs are valid on the next rising edge of CCLK.							
1	FPGA deselected. All SelectMAP inputs are ignored.							

Table 4: Dual-Purpose Configuration Pins for Parallel (SelectMAP) Configuration Modes (Continued)

Pin Name	Direction	Description								
RDWR_B	Input	Read/Write Control for Parallel Mode Configuration: In Master and Slave Parallel modes, assert this pin Low together with CS_B to write a configuration data byte from the D0-D7 bus to the FPGA on a rising CCLK edge. Once asserted during configuration, RDWR_B must remain asserted until configuration is complete. During Readback, assert this pin High with CS_B Low to read a configuration data byte from the FPGA to the D0-D7 bus on a rising CCLK edge. This signal is located in Bank 5 and powered by VCCO_5. The BitGen option Persist permits this pin to retain its configuration function in the User mode. <table><tr><th>RDWR_B</th><th>Function</th></tr><tr><td>0</td><td>If CS_B is Low, then load (write) configuration data to the FPGA.</td></tr><tr><td>1</td><td>This option is valid only if the Persist bitstream option is set to Yes. If CS_B is Low, then read configuration data from the FPGA.</td></tr></table>	RDWR_B	Function	0	If CS_B is Low, then load (write) configuration data to the FPGA.	1	This option is valid only if the Persist bitstream option is set to Yes. If CS_B is Low, then read configuration data from the FPGA.		
RDWR_B	Function									
0	If CS_B is Low, then load (write) configuration data to the FPGA.									
1	This option is valid only if the Persist bitstream option is set to Yes. If CS_B is Low, then read configuration data from the FPGA.									
BUSY	Output	Configuration Data Rate Control for Parallel Mode: In the Slave and Master Parallel modes, BUSY throttles the rate at which configuration data is loaded. BUSY is only necessary if CCLK operates at greater than 50 MHz. Ignore BUSY for frequencies of 50 MHz and below. When BUSY is Low, the FPGA accepts the next configuration data byte on the next rising CCLK edge for which CS_B and RDWR_B are Low. When BUSY is High, the FPGA ignores the next configuration data byte. The next configuration data value must be held or reloaded until the next rising CCLK edge when BUSY is Low. When CS_B is High, BUSY is in a high impedance state. <table><tr><th>BUSY</th><th>Function</th></tr><tr><td>0</td><td>The FPGA is ready to accept the next configuration data byte.</td></tr><tr><td>1</td><td>The FPGA is busy processing the current configuration data byte and is not ready to accept the next byte.</td></tr><tr><td>Hi-Z</td><td>If CS_B is High, then BUSY is high impedance.</td></tr></table> This signal is located in Bank 4 and its output voltage is determined by VCCO_4. The BitGen option Persist permits this pin to retain its configuration function in the User mode.	BUSY	Function	0	The FPGA is ready to accept the next configuration data byte.	1	The FPGA is busy processing the current configuration data byte and is not ready to accept the next byte.	Hi-Z	If CS_B is High, then BUSY is high impedance.
BUSY	Function									
0	The FPGA is ready to accept the next configuration data byte.									
1	The FPGA is busy processing the current configuration data byte and is not ready to accept the next byte.									
Hi-Z	If CS_B is High, then BUSY is high impedance.									
INIT_B	Bidirectional (open-drain)	Initializing Configuration Memory/Configuration Error (active-Low): See description under Serial Configuration Modes, page 7.								

JTAG Configuration Mode

In the JTAG configuration mode all dual-purpose configuration pins are unused and behave exactly like user-I/O pins, as shown in Table 10. See Table 7 for Mode Select pin settings required for JTAG mode.

Dual-Purpose Pin I/O Standard During Configuration

During configuration, the dual-purpose pins default to CMOS input and output levels for the associated VCCO voltage supply pins. For example, in the Parallel configuration modes, both VCCO_4 and VCCO_5 are required. If connected to +2.5V, then the associated pins conform to the

LVC MOS25 I/O standard. If connected to +3.3V, then the pins drive LVC MOS output levels and accept either LV TTL or LVC MOS input levels.

Dual-Purpose Pin Behavior After Configuration

After the configuration process completes, these pins, if they were borrowed during configuration, become user-I/O pins available to the application. If a dual-purpose configuration pin is not used during the configuration process—i.e., the parallel configuration pins when using serial mode—then the pin behaves exactly like a general-purpose I/O. See **I/O Type: Unrestricted, General-purpose I/O Pins** section above.

DCI: User I/O or Digitally Controlled Impedance Resistor Reference Input

These pins are individual user-I/O pins unless one of the I/O standards used in the bank requires the Digitally Controlled Impedance (DCI) feature. If DCI is used, then 1% precision resistors connected to the VRP_# and VRN_# pins match the impedance on the input or output buffers of the I/O standards that use DCI within the bank.

The '#' character in the pin name indicates the associated I/O bank and is an integer, 0 through 7.

There are two DCI pins per I/O bank, except in the TQ144 package, which does not have any DCI inputs for Bank 5.

VRP and VRN Impedance Resistor Reference Inputs

The 1% precision impedance-matching resistor attached to the VRP_# pin controls the pull-up impedance of PMOS transistor in the input or output buffer. Consequently, the VRP_# pin must connect to ground. The 'P' character in "VRP" indicates that this pin controls the I/O buffer's PMOS transistor impedance. The VRP_# pin is used for both single and split termination.

The 1% precision impedance-matching resistor attached to the VRN_# pin controls the pull-down impedance of NMOS transistor in the input or output buffer. Consequently, the VRN_# pin must connect to VCCO. The 'N' character in "VRN" indicates that this pin controls the I/O buffer's NMOS transistor impedance. The VRN_# pin is only used for split termination.

Each VRN or VRP reference input requires its own resistor. A single resistor cannot be shared between VRN or VRP pins associated with different banks.

During configuration, these pins behave exactly like user-I/O pins. The associated DCI behavior is not active or valid until after configuration completes.

See "**Digitally Controlled Impedance (DCI)**" in Module 2: **Functional Description**.

DCI Termination Types

If the I/O in an I/O bank do not use the DCI feature, then no external resistors are required and both the VRP_# and VRN_# pins are available for user I/O, as shown in **Figure 3a**.

If the I/O standards within the associated I/O bank require single termination—such as GTL_DCI, GTLP_DCI, or HSTL_III_DCI—then only the VRP_# signal connects to a 1% precision impedance-matching resistor, as shown in **Figure 3b**. A resistor is not required for the VRN_# pin.

Finally, if the I/O standards with the associated I/O bank require split termination—such as HSTL_I_DCI,

SSTL2_I_DCI, SSTL2_II_DCI, or LVDS_25_DCI and LVDSEXT_25_DCI receivers—then both the VRP_# and VRN_# pins connect to separate 1% precision impedance-matching resistors, as shown in **Figure 3c**. Neither pin is available for user I/O.

GCLK: Global Clock Buffer Inputs or General-Purpose I/O Pins

These pins are user-I/O pins unless they specifically connect to one of the eight low-skew global clock buffers on the device, specified using the IBUFG primitive.

There are eight GCLK pins per device and two each appear in the top-edge banks, Bank 0 and 1, and the bottom-edge banks, Banks 4 and 5. See **Figure 1** for a picture of bank labeling.

During configuration, these pins behave exactly like user-I/O pins.

CONFIG: Dedicated Configuration Pins

The dedicated configuration pins control the configuration process and are not available as user-I/O pins. Every package has seven dedicated configuration pins. All CONFIG-type pins are powered by the +2.5V VCCAUX supply.

See "**Configuration**" in Module 2: **Functional Description**.

CCLK: Configuration Clock

The configuration clock signal on this pin synchronizes the reading or writing of configuration data. This pin is an input for the Slave configuration modes, both parallel and serial.

After configuration, the CCLK pin is in a high-impedance, floating state. By default, CCLK optionally is pulled High to VCCAUX as defined by the CclkPin bitstream selection. Any clocks applied to CCLK after configuration are ignored unless the bitstream option Persist is set to Yes, which retains the configuration interface. Persist is set to No by default. However, if Persist is set to Yes, then all clock edges are potentially active events, depending on the other configuration control signals.

The bitstream generator option ConfigRate determines the frequency of the internally-generated CCLK oscillator required for the Master configuration modes. The actual frequency is approximate due to the characteristics of the silicon oscillator and varies by up to 30% over the temperature and voltage range. By default, CCLK operates at approximately 6 MHz. Via the ConfigRate option, the oscillator frequency is set at approximately 3, 6, 12, 25, or 50 MHz. At power-on, CCLK always starts operation at its lowest frequency. The device does not start operating at the higher frequency until the ConfigRate control bits are loaded during the configuration process.

Figure 3: DCI Termination Types

PROG_B: Program/Configure Device

This asynchronous pin initiates the configuration or re-configuration processes. A Low-going pulse resets the configuration logic, initializing the configuration memory. This initialization process cannot finish until PROG_B returns High. Asserting PROG_B Low for an extended period delays the configuration process. At power-up, there is always a weak pull-up resistor to VCCAUX on this pin. After configuration, the bitstream generator option ProgPin determines whether or not the weak pull-up resistor is present. By default, the ProgPin option retains the weak pull-up resistor.

After configuration, hold the PROG_B input High. Any Low-going pulse on PROG_B restarts the configuration process.

Table 5: PROG_B Operation

PROG_B Input	Response
Power-up	Automatically initiates configuration process.
Low-going pulse 	Initiate (re-)configuration process and continue to completion.
Extended Low 	Initiate (re-)configuration process and stall process at step where configuration memory is cleared. Process is stalled until PROG_B returns High.
1	If the configuration process is started, continue to completion. If configuration process is complete, stay in User mode.

DONE: Configuration Done, Delay Start-Up Sequence

The FPGA produces a Low-to-High transition on this pin indicating that the configuration process is complete. The bitstream generator option DriveDone determines whether this pin functions as a totem-pole output that can drive High or as an open-drain output. If configured as an open-drain output—which is the default behavior—then a pull-up resistor is required to produce a High logic level. There is a bitstream option that provides an internal weak pull-up resistor, otherwise an external pull-up resistor is required.

The open-drain option permits the DONE lines of multiple FPGAs to be tied together, so that the common node transitions High only after all of the FPGAs have completed configuration. Externally holding the open-drain DONE pin Low delays the start-up sequence, which marks the transition to user mode.

Once the FPGA enters User mode after completing configuration, the DONE pin no longer drives the DONE pin Low. The bitstream generator option DonePin determines whether or not a weak pull-up resistor is present on the DONE pin to pull the pin to VCCAUX. If the weak pull-up resistor is eliminated, then the DONE pin must be pulled High using an external pull-up resistor or one of the FPGAs in the design must actively drive the DONE pin High via the DriveDone bitstream generator option.

The bitstream generator option DriveDone causes the FPGA to actively drive the DONE output High after configuration. This option should only be used in single-FPGA designs or on the last FPGA in a multi-FPGA daisy-chain.

By default, the bitstream generator software retains the weak pull-up resistor and does not actively drive the DONE pin as highlighted in Table 6. Table 6 shows the interaction of these bitstream options in single- and multi-FPGA designs.

Table 6: DonePin and DriveDone Bitstream Option Interaction

DonePin	DriveDone	Single- or Multi-FPGA Design	Comments
Pullnone	No	Single	External pull-up resistor, with value between 330Ω to 3.3kΩ required on DONE.
Pullnone	No	Multi	External pull-up resistor, with value between 330Ω to 3.3kΩ required on common node connecting to all DONE pins.
Pullnone	Yes	Single	OK, no external requirements.
Pullnone	Yes	Multi	DriveDone on last device in daisy-chain only. No external requirements.
Pullup	No	Single	OK, but weak pull-up on DONE pin has slow rise time. May require 330 Ω pull-up resistor for high CCLK frequencies.
Pullup	No	Multi	External pull-up resistor, with value between 330Ω to 3.3kΩ required on common node connecting to all DONE pins.
Pullup	Yes	Single	OK, no external requirements.
Pullup	Yes	Multi	DriveDone on last device in daisy-chain only. No external requirements.

M2, M1, M0: Configuration Mode Selection

These inputs select the mode to configure the FPGA. The logic levels applied to the mode pins are sampled on the rising edge of INIT_B.

Table 7: Spartan-3 Configuration Mode Select Settings

Configuration Mode	M2	M1	M0
Master Serial	0	0	0
Slave Serial	1	1	1
Master Parallel	0	1	1
Slave Parallel	1	1	0
JTAG	1	0	1
Reserved	0	0	1
Reserved	0	1	0
Reserved	1	0	0
After Configuration	X	X	X

Notes:

1. X = don't care, either 0 or 1.

In user mode, after configuration successfully completes, any levels applied to these input are ignored. Each of the bitstream generator options M0Pin, M1Pin, and M2Pin determines whether a weak pull-up resistor, weak pull-down resistor, or no resistor is present on its respective mode pin, M0, M1, or M2.

HSWAP_EN: Disable Weak Pull-up Resistors During Configuration

A Low on this asynchronous pin enables weak pull-up resistors on all user I/Os, although only until device configuration

completes. A High disables the weak pull-up resistors (during configuration, which is the desired state for some applications.

Table 8: HSWAP_EN Encoding

HSWAP_EN	Function
During Configuration	
0	Enable weak pull-up resistors on all pins not actively involved in the configuration process. Pull-ups are only active until configuration completes. See Table 10.
1	No pull-up resistors during configuration.
After Configuration, User Mode	
X	This pin has no function except during device configuration.

Notes:

1. X = don't care, either 0 or 1.

After configuration, HSWAP_EN essentially becomes a "don't care" input and any pull-up resistors previously enabled by HSWAP_EN are disabled. If a user I/O in the application requires a weak pull-up resistor after configuration, place a PULLUP primitive on the associated I/O pin.

The Bitstream generator option HswapenPin determines whether a weak pull-up resistor to VCCAUX, a weak pull-down resistor, or no resistor is present on HSWAP_EN after configuration.

JTAG: Dedicated JTAG Port Pins

These pins are dedicated connections to the four-wire IEEE 1532/IEEE 1149.1 JTAG port, shown in Figure 4 and

described in Table 9. The JTAG port is used for boundary-scan testing, device configuration, application debugging, and possibly an additional serial port for the application. These pins are dedicated and are not available as user-I/O pins. Every package has four dedicated JTAG pins and these pins are powered by the +2.5V VCCAUX supply.

Figure 4: JTAG Port

Using JTAG Port After Configuration

The JTAG port is always active and available before, during, and after FPGA configuration. Add the BSCAN_SPARTAN3 primitive to the design to create user-defined JTAG instructions and JTAG chains to communicate with internal logic.

Furthermore, the contents of the User ID register within the JTAG port can be specified as a Bitstream Generation option. By default, the 32-bit User ID register contains 0xFFFFFFFF.

Precautions When Using the JTAG Port in 3.3V Environments

The JTAG port is powered by the +2.5V VCCAUX power supply. When connecting to a 3.3V interface, the JTAG input pins must be current-limited to 10 mA or less using a series

resistor. Similarly, the TDO pin is a CMOS output powered from +2.5V. The TDO output can directly drive a 3.3V input but with reduced noise immunity. See the **3.3V-Tolerant Configuration Interface** section in Module 2: **Functional Description** for additional details.

The following interface precautions are recommended when connecting the JTAG port to a 3.3V interface.

1. Set any inactive JTAG signals, including TCK, Low when not actively used.
2. Limit the drive current into a JTAG input to no more than 10 mA.

VREF: User I/O or Input Buffer Reference Voltage for Special Interface Standards

These pins are individual user-I/O pins unless collectively they supply an input reference voltage, VREF_#, for any SSTL, HSTL, GTL, or GTLP I/Os implemented in the associated I/O bank.

The '#' character in the pin name represents an integer, 0 through 7, that indicates the associated I/O bank.

The VREF function becomes active for this pin whenever a signal standard requiring a reference voltage is used in the associated bank.

If used as a user I/O, then each pin behaves as an independent I/O described in the I/O type section. If used for a reference voltage within a bank, then all VREF pins within the bank must be connected to the same reference voltage.

Spartan-3 devices are designed and characterized to support certain I/O standards when VREF is connected to +1.25V, +1.10V, +1.00V, +0.90V, +0.80V, and +0.75V.

During configuration, these pins behave exactly like user-I/O pins.

Table 9: JTAG Pin Descriptions

Pin Name	Direction	Description	Bitstream Generation Option
TCK	Input	Test Clock: The TCK clock signal synchronizes all boundary scan operations on its rising edge.	The BitGen option TckPin determines whether a weak pull-up resistor, weak pull-down resistor or no resistor is present.
TDI	Input	Test Data Input: TDI is the serial data input for all JTAG instruction and data registers. This input is sampled on the rising edge of TCK.	The BitGen option TdiPin determines whether a weak pull-up resistor, weak pull-down resistor or no resistor is present.
TMS	Input	Test Mode Select: The TMS input controls the sequence of states through which the JTAG TAP state machine passes. This input is sampled on the rising edge of TCK.	The BitGen option TmsPin determines whether a weak pull-up resistor, weak pull-down resistor or no resistor is present.
TDO	Output	Test Data Output: The TDO pin is the data output for all JTAG instruction and data registers. This output is sampled on the rising edge of TCK. The TDO output is an active totem-pole driver and is not like the open-collector TDO output on Virtex-II Pro™ FPGAs.	The BitGen option TdoPin determines whether a weak pull-up resistor, weak pull-down resistor or no resistor is present.

If designing for footprint compatibility across the range of devices in a specific package, and if the VREF_# pins within a bank connect to an input reference voltage, then also connect any N.C. (not connected) pins on the smaller devices in that package to the input reference voltage. More details are provided later for each package type.

N.C. Type: Unconnected Package Pins

Pins marked as “N.C.” are unconnected for the specific device/package combination. For other devices in this same package, this pin may be used as an I/O or VREF connection. In both the pinout tables and the footprint diagrams, unconnected pins are noted with either a black diamond symbol (◆) or a black square symbol (■).

If designing for footprint compatibility across multiple device densities, check the pin types of the other Spartan-3 devices available in the same footprint. If the N.C. pin matches to VREF pins in other devices, and the VREF pins are used in the associated I/O bank, then connect the N.C. to the VREF voltage source.

VCCO Type: Output Voltage Supply for I/O Bank

Each I/O bank has its own set of voltage supply pins that determines the output voltage for the output buffers in the I/O bank. Furthermore, for some I/O standards such as LVCMOS, LVCMOS25, LVTTTL, etc., VCCO sets the input threshold voltage on the associated input buffers.

Spartan-3 devices are designed and characterized to support various I/O standards for VCCO values of +1.2V, +1.5V, +1.8V, +2.5V, and +3.3V.

Most VCCO pins are labeled as VCCO_# where the ‘#’ symbol represents the associated I/O bank number, an integer ranging from 0 to 7. In the 144-pin TQFP package (TQ144) however, the VCCO pins along an edge of the device are combined into a single VCCO input. For example, the VCCO inputs for Bank 0 and Bank 1 along the top edge of the package are combined and relabeled VCCO_TOP. The bottom, left, and right edges are similarly combined.

In Serial configuration mode, VCCO_4 must be at a level compatible with the attached configuration memory or data source. In Parallel configuration mode, both VCCO_4 and VCCO_5 must be at the same compatible voltage level.

All VCCO inputs to a bank must be connected together and to the voltage supply. Furthermore, there must be sufficient supply decoupling to guarantee problem-free operation, as described in [XAPP623: Power Distribution System \(PDS\) Design: Using Bypass/Decoupling Capacitors](#).

VCCINT Type: Voltage Supply for Internal Core Logic

Internal core logic circuits such as the configurable logic blocks (CLBs) and programmable interconnect operate

from the VCCINT voltage supply inputs. VCCINT must be +1.2V.

All VCCINT inputs must be connected together and to the +1.2V voltage supply. Furthermore, there must be sufficient supply decoupling to guarantee problem-free operation, as described in [XAPP623: Power Distribution System \(PDS\) Design: Using Bypass/Decoupling Capacitors](#).

VCCAUX Type: Voltage Supply for Auxiliary Logic

The VCCAUX pins supply power to various auxiliary circuits, such as to the Digital Clock Managers (DCMs), the JTAG pins, and to the dedicated configuration pins (CONFIG type). VCCAUX must be +2.5V.

All VCCAUX inputs must be connected together and to the +2.5V voltage supply. Furthermore, there must be sufficient supply decoupling to guarantee problem-free operation, as described in [XAPP623: Power Distribution System \(PDS\) Design: Using Bypass/Decoupling Capacitors](#).

Because VCCAUX connects to the DCMs and the DCMs are sensitive to voltage changes, be sure that the VCCAUX supply and the ground return paths are designed for low noise and low voltage drop, especially that caused by a large number of simultaneous switching I/Os.

GND Type: Ground

All GND pins must be connected and have a low resistance path back to the various VCCO, VCCINT, and VCCAUX supplies.

Pin Behavior During Configuration

Table 10 shows how various pins behave during the FPGA configuration process. The actual behavior depends on the values applied to the M2, M1, and M0 mode select pins and the HSWAP_EN pin. The mode select pins determine which of the DUAL type pins are active during configuration. In JTAG configuration mode, none of the DUAL-type pins are used for configuration and all behave as user-I/O pins.

All DUAL-type pins not actively used during configuration and all I/O-type, DCI-type, VREF-type, GCLK-type pins are high impedance (floating, three-stated, Hi-Z) during the configuration process. These pins are indicated in **Table 10** as shaded table entries or cells. These pins have a weak pull-up resistor to their associated VCCO if the HSWAP_EN pin is Low.

After configuration completes, some pins have optional behavior controlled by the configuration bitstream loaded into the part. For example, via the bitstream, all unused I/O pins can collectively be configured to have a weak pull-up resistor, a weak pull-down resistor, or be left in a high-impedance state.

Table 10: Pin Behavior After Power-Up, During Configuration

Pin Name	Configuration Mode Settings <M2:M1:M0>					Bitstream Configuration Option
	Serial Modes		SelectMap Parallel Modes		JTAG Mode <1:0:1>	
	Master <0:0:0>	Slave <1:1:1>	Master <0:1:1>	Slave <1:1:0>

	Serial Modes		SelectMap Parallel Modes		JTAG Mode <1:0:1>	
	Master <0:0:0>	Slave <1:1:1>	Master <0:1:1>	Slave <1:1:0>		
VCCINT: Internal core voltage supply pins						
VCCINT	+1.2V	+1.2V	+1.2V	+1.2V	+1.2V	
GND: Ground supply pins						
GND	GND	GND	GND	GND	GND	

Notes:

1. # = I/O bank number, an integer from 0 to 7.
2. (I) = input, (O) = output, (OD) = open-drain output, (I/O) = bidirectional, (I/OD) = bidirectional with open-drain output. Open-drain output requires pull-up to create logic High level.
3. Shaded cell indicates that the pin is high-impedance during configuration. To enable a soft pull-up resistor during configuration, drive or tie HSWAP_EN Low.

Bitstream Options

Table 11 lists the various bitstream options that affect pins on a Spartan-3 FPGA. The table shows the names of the affected pins, describes the function of the bitstream option,

the name of the bitstream generator option variable, and the legal values for each variable. The default option setting for each variable is indicated with bold, underlined text.

Table 11: Bitstream Options Affecting Spartan-3 Pins

Affected Pin Name(s)	Bitstream Generation Function	Option Variable Name	Values (default value)
All unused I/O pins of type I/O, DUAL, GCLK, DCI, VREF	For all I/O pins that are unused after configuration, this option defines whether the I/Os are individually tied to VCCO via a weak pull-up resistor, tied ground via a weak pull-down resistor, or left floating. If left floating, the unused pins should be connected to a defined logic level, either from a source internal to the FPGA or external.	UnusedPin	• <u>Pulldown</u> • Pullup • Pullnone
IO_Lxxy_#/DIN, IO_Lxxy_#/DOUT, IO_Lxxy_#/INIT_B	Serial configuration mode: If set to Yes, then these pins retain their functionality after configuration completes, allowing for device (re-)configuration. Readback is not supported in with serial mode.	Persist	• <u>No</u> • Yes
IO_Lxxy_#/D0, IO_Lxxy_#/D1, IO_Lxxy_#/D2, IO_Lxxy_#/D3, IO_Lxxy_#/D4, IO_Lxxy_#/D5, IO_Lxxy_#/D6, IO_Lxxy_#/D7, IO_Lxxy_#/CS_B, IO_Lxxy_#/RDWR_B, IO_Lxxy_#/BUSY, IO_Lxxy_#/INIT_B	Parallel configuration mode (also called SelectMAP): If set to Yes, then these pins retain their SelectMAP functionality after configuration completes, allowing for device readback and for partial or complete (re-)configuration.	Persist	• <u>No</u> • Yes
CCLK	After configuration, this bitstream option either pulls CCLK to VCCAUX via a weak pull-up resistor, or allows CCLK to float.	CclkPin	• <u>Pullup</u> • Pullnone
CCLK	For Master configuration modes, this option sets the approximate frequency, in MHz, for the internal silicon oscillator.	ConfigRate	3, <u>6</u> , 12, 25, 50

Table 11: Bitstream Options Affecting Spartan-3 Pins (Continued)

Affected Pin Name(s)	Bitstream Generation Function	Option Variable Name	Values (default value)
PROG_B	A weak pull-up resistor to VCCAUX exists on PROG_B during configuration. After configuration, this bitstream option either pulls DONE to VCCAUX via a weak pull-up resistor, or allows DONE to float.	ProgPin	Pullup - Pullnone
DONE	After configuration, this bitstream option either pulls DONE to VCCAUX via a weak pull-up resistor, or allows DONE to float. See also DriveDone option.	DonePin	Pullup - Pullnone
DONE	If set to Yes, this option allows the FPGA's DONE pin to drive High when configuration completes. By default, the DONE is an open-drain output and can only drive Low. Only single FPGAs and the last FPGA in a multi-FPGA daisy-chain should use this option.	DriveDone	No - Yes
M2	After configuration, this bitstream option either pulls M2 to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows M2 to float.	M2Pin	Pullup - Pulldown - Pullnone
M1	After configuration, this bitstream option either pulls M1 to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows M1 to float.	M1Pin	Pullup - Pulldown - Pullnone
M0	After configuration, this bitstream option either pulls M0 to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows M0 to float.	M0Pin	Pullup - Pulldown - Pullnone
HSWAP_EN	After configuration, this bitstream option either pulls HSWAP_EN to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows HSWAP_EN to float.	HswapenPin	Pullup - Pulldown - Pullnone
TDI	After configuration, this bitstream option either pulls TDI to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows TDI to float.	TdiPin	Pullup - Pulldown - Pullnone
TMS	After configuration, this bitstream option either pulls TMS to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows TMS to float.	TmsPin	Pullup - Pulldown - Pullnone
TCK	After configuration, this bitstream option either pulls TCK to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows TCK to float.	TckPin	Pullup - Pulldown - Pullnone
TDO	After configuration, this bitstream option either pulls TDO to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows TDO to float.	TdoPin	Pullup - Pulldown - Pullnone

Setting Options via BitGen Command-Line Program

To set one or more bitstream generator options using the BitGen command-line program, enter

```
bitgen -g <variable_name>:<value>
[<variable_name>:<value> ...]
```

where **<variable_name>** is one of the entries from Table 11 and **<value>** is one of the possible values for the specified variable. Multiple bitstream options may be entered in this manner.

For a complete listing of all BitGen options, their possible settings, and their default settings, enter the following command.

```
bitgen -help spartan3
```

Setting Options in Project Navigator

To set the bitstream generation options in Xilinx ISE Project Navigator, right-click on the **Generate Programming File** step in the Process View and click **Properties**, as shown in Figure 5.

Click the **Configuration options** tab and modify the available options as required by the application, as shown in Figure 6.

DS099-4_05_030103

Figure 5: Setting Properties for Generate Programming File Step

DS099-4_06_030103

Figure 6: Configuration Option Settings

DS099-4_07_030103

Figure 7: Setting to Drive DONE Pin High after Configuration

To have the DONE pin drive High after successful configuration, click the **Startup options** tab and check the **Drive Done Pin High** box, as shown in Figure 7.

Click **OK** when finished.

Again, right-click on the **Generate Programming File** step in the Process View. This time, choose **Run** or **Rerun** to execute the changes.

Package Overview

Table 12 shows the nine low-cost, space-saving production package styles for the Spartan-3 family. Each package style

is available as a standard and an environmentally-friendly lead-free (Pb-free) option. The Pb-free packages include an extra 'G' in the package style name. For example, the standard "VQ100" package becomes "VQG100" when ordered as the Pb-free option. The mechanical dimensions of the standard and Pb-free packages are similar, as shown in the mechanical drawings provided in Table 13.

Not all Spartan-3 densities are available in all packages. However, for a specific package there is a common footprint for that supports the various devices available in that package. See the footprint diagrams that follow.

Table 12: Spartan-3 Family Package Options

Package	Leads	Type	Maximum I/O	Pitch (mm)	Area (mm)	Height (mm)
VQ100 / VQG100	100	Very-thin Quad Flat Pack	63	0.5	16 x 16	1.20
TQ144 / TQG144	144	Thin Quad Flat Pack	97	0.5	22 x 22	1.60
PQ208 / PQG208	208	Quad Flat Pack	141	0.5	30.6 x 30.6	4.10
FT256 / FTG256	256	Fine-pitch, Thin Ball Grid Array	173	1.0	17 x 17	1.55
FG320 / FGG320	320	Fine-pitch Ball Grid Array	221	1.0	19 x 19	2.00
FG456 / FGG456	456	Fine-pitch Ball Grid Array	333	1.0	23 x 23	2.60
FG676 / FGG676	676	Fine-pitch Ball Grid Array	489	1.0	27 x 27	2.60
FG900 / FGG900	900	Fine-pitch Ball Grid Array	633	1.0	31 x 31	2.60
FG1156 / FGG1156	1156	Fine-pitch Ball Grid Array	784	1.0	35 x 35	2.60

Detailed mechanical drawings for each package type are available from the Xilinx website at the specified location in [Table 13](#).

Each package has three separate voltage supply inputs—VCCINT, VCCAUX, and VCCO—and a common ground return, GND. The numbers of pins dedicated to these functions varies by package, as shown in [Table 14](#).

Table 14: Power and Ground Supply Pins by Package

Package	VCCINT	VCCAUX	VCCO	GND
VQ100	4	4	8	10
TQ144	4	4	12	16
PQ208	4	8	12	28
FT256	8	8	24	32
FG320	12	8	28	40
FG456	12	8	40	52
FG676	20	16	64	76
FG900	32	24	80	120
FG1156	40	32	104	184

A majority of package pins are user-defined I/O pins. However, the numbers and characteristics of these I/O depends on the device type and the package in which it is available, as shown in [Table 15](#). The table shows the maximum number of single-ended I/O pins available, assuming that all I/O-, DUAL-, DCI-, VREF-, and GCLK-type pins are used as general-purpose I/O. Likewise, the table shows the maximum number of differential pin-pairs available on the package. Finally, the table shows how the total maximum user I/Os are distributed by pin type, including the number of unconnected—i.e., N.C.—pins on the device.

Table 15: Maximum User I/Os by Package

Device	Package	Maximum User I/Os	Maximum Differential Pairs	All Possible I/O Pins by Type					N.C.
				I/O	DUAL	DCI	VREF	GCLK	
XC3S50	VQ100	63	29	22	12	14	7	8	0

Electronic versions of the package pinout tables and footprints are available for download from the Xilinx website. Using a spreadsheet program, the data can be sorted and reformatted according to any specific needs. Similarly, the

ASCII-text file is easily parsed by most scripting programs. Download the files from the following location:

http://www.xilinx.com/bvdocs/publications/s3_pin.zip

VQ100: 100-lead Very-thin Quad Flat Package

The XC3S50 and the XC3S200 devices are available in the 100-lead very-thin quad flat package, VQ100. Both devices share a common footprint for this package as shown in [Table 16](#) and [Figure 8](#).

All the package pins appear in [Table 16](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

Pinout Table

22	I/O: Unrestricted, general-purpose user I/O	12	DUAL: Configuration pin, then possible user I/O	7	VREF: User I/O or input voltage reference for bank
14	DCI: User I/O or reference resistor input for bank	8	GCLK: User I/O or global clock buffer input	8	VCCO: Output voltage supply for bank
7	CONFIG: Dedicated configuration pins	4	JTAG: Dedicated JTAG port pins	4	VCCINT: Internal core voltage supply (+1.2V)
0	N.C.: No unconnected pins in this package	10	GND: Ground	4	VCCAUX: Auxiliary voltage supply (+2.5V)

TQ144: 144-lead Thin Quad Flat Package

The XC3S50, the XC3S200, and the XC3S400 are available in the 144-lead thin quad flat package, TQ144. Consequently, there is only one footprint for this package as shown in [Table 18](#) and [Figure 9](#).

The TQ144 package only has four separate VCCO inputs, unlike the other packages, which have eight separate VCCO inputs. The TQ144 package has a separate VCCO input for the top, bottom, left, and right. However, there are still eight separate I/O banks, as shown in [Table 18](#) and [Figure 9](#). Banks 0 and 1 share the VCCO_TOP input, Banks 2 and 3 share the VCCO_RIGHT input, Banks 4 and 5 share the VCCO_BOTTOM input, and Banks 6 and 7 share the VCCO_LEFT input.

All the package pins appear in [Table 18](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

Pinout Table

Table 18: TQ144 Package Pinout

Bank	XC3S50 XC3S200 XC3S400 Pin Name	TQ144 Pin Number	Type

User I/Os by Bank

Table 19 indicates how the available user-I/O pins are distributed between the eight I/O banks on the TQ144 package.

Table 19: User I/Os Per Bank in TQ144 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	10	5	0	2	1	2
	1	9	4	0	2	1	2
Right	2	14	10	0	2	2	0
	3	15	11	0	2	2	0
Bottom	4	11	0	6	2	1	2
	5	9	0	6	0	1	2
Left	6	14	10	0	2	2	0
	7	15	11	0	2	2	0

TQ144 Footprint

DS099-4_08_121103

Figure 9: TQ144 Package Footprint (top view). Note pin 1 indicator in top-left corner and logo orientation.

51	I/O: Unrestricted, general-purpose user I/O	12	DUAL: Configuration pin, then possible user I/O	12	VREF: User I/O or input voltage reference for bank
14	DCI: User I/O or reference resistor input for bank	8	GCLK: User I/O or global clock buffer input	12	VCCO: Output voltage supply for bank
7	CONFIG: Dedicated configuration pins	4	JTAG: Dedicated JTAG port pins	4	VCCINT: Internal core voltage supply (+1.2V)
0	N.C.: No unconnected pins in this package	16	GND: Ground	4	VCCAUX: Auxiliary voltage supply (+2.5V)

PQ208: 208-lead Plastic Quad Flat Pack

The 208-lead plastic quad flat package, PQ208, supports three different Spartan-3 devices, including the XC3S50, the XC3S200, and the XC3S400. The footprints for the XC3S200 and XC3S400 are identical, as shown in [Table 20](#) and [Figure 10](#). The XC3S50, however, has fewer I/O pins resulting in 17 unconnected pins on the PQ208 package, labeled as “N.C.” In [Table 20](#) and [Figure 10](#), these unconnected pins are indicated with a black diamond symbol (◆).

All the package pins appear in [Table 20](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S50 pinout and the pinout for the XC3S200 and XC3S400, then that difference is highlighted in [Table 20](#). If the table entry is shaded grey, then there is an unconnected pin on the XC3S50 that maps to a user-I/O pin on the XC3S200 and XC3S400. If the table entry is shaded tan, then the unconnected pin on the XC3S50 maps to a VREF-type pin on the XC3S200 and XC3S400. If the other VREF pins in the bank all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S50 to the same VREF voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S50 device to an XC3S200 or XC3S400 FPGA without changing the printed circuit board.

Pinout Table

Table 20: PQ208 Package Pinout

Bank	XC3S50 Pin Name	XC3S200 XC3S400 Pin Name	PQ208 Pin Number	Type

User I/Os by Bank

Table 21 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S50 in the PQ208 package. Similarly, Table 22 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S200 and XC3S400 in the PQ208 package.

Table 21: User I/Os Per Bank for XC3S50 in PQ208 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK

FT256: 256-lead Fine-pitch Thin Ball Grid Array

The 256-lead fine-pitch thin ball grid array package, FT256, supports three different Spartan-3 devices, including the XC3S200, the XC3S400, and the XC3S1000. The footprints for all three devices are identical, as shown in [Table 23](#) and [Figure 11](#).

All the package pins appear in [Table 23](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

Pinout Table

User I/Os by Bank

Table 24 indicates how the available user-I/O pins are distributed between the eight I/O banks on the FT256 package.

Table 24: User I/Os Per Bank in FT256 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	20	13	0	2	3	2
	1	20	13	0	2	3	2
Right	2	23	18	0	2	3	0
	3	23	18	0	2	3	0
Bottom	4	21	8	6	2	3	2

FT256 Footprint

DS099-4_10_030503

Figure 11: FT256 Package Footprint (top view)

113	I/O: Unrestricted, general-purpose user I/O	12	DUAL: Configuration pin, then possible user I/O	24	VREF: User I/O or input voltage reference for bank
16	DCI: User I/O or reference resistor input for bank	8	GCLK: User I/O or global clock buffer input	24	VCCO: Output voltage supply for bank
7	CONFIG: Dedicated configuration pins	4	JTAG: Dedicated JTAG port pins	8	VCCINT: Internal core voltage supply (+1.2V)
0	N.C.: No unconnected pins in this package	32	GND: Ground	8	VCCAUX: Auxiliary voltage supply (+2.5V)

FG320: 320-lead Fine-pitch Ball Grid Array

The 320-lead fine-pitch ball grid array package, FG320, supports three different Spartan-3 devices, including the XC3S400, the XC3S1000, and the XC3S1500. The footprint for all three devices is identical, as shown in [Table 25](#) and [Figure 12](#).

The FG320 package is an 18 x 18 array of solder balls minus the four center balls.

All the package pins appear in [Table 25](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

Pinout Table

FG456: 456-lead Fine-pitch Ball Grid Array

The 456-lead fine-pitch ball grid array package, FG456, supports three different Spartan-3 devices, including the XC3S400, the XC3S1000, and the XC3S1500. The footprints for the XC3S1000 and XC3S1500 are identical, as shown in [Table 27](#) and [Figure 13](#). The XC3S400, however, has fewer I/O pins which consequently results in 69 unconnected pins on the FG456 package, labeled as “N.C.” In [Table 27](#) and [Figure 13](#), these unconnected pins are indicated with a black diamond symbol (◆).

All the package pins appear in [Table 27](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S400 pinout and the pinout for the XC3S1000 and XC3S1500, then that difference is highlighted in [Table 27](#). If the table entry is shaded grey, then there is an unconnected pin on the XC3S400 that maps to a user-I/O pin on the XC3S1000 and XC3S1500. If the table entry is shaded tan, then the unconnected pin on the XC3S400 maps to a VREF-type pin on the XC3S1000 and XC3S1500. If the other VREF pins in the bank all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S400 to the same VREF voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S400 device to an XC3S1000 or XC3S1500 FPGA without changing the printed circuit board.

Pinout Table

User I/Os by Bank

Table 28 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S400 in the FG456 package. Similarly, Table 29 shows how the avail-

able user-I/O pins are distributed between the eight I/O banks for the XC3S1000 and XC3S1500 in the FG456 package.

Table 28: User I/Os Per Bank for XC3S400 in FG456 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	35	27	0	2	4	2
	1	35	27	0	2	4	2
Right	2	31	25	0	2	4	0
	3	31	25	0	2	4	0
Bottom	4	35	21	6	2	4	2
	5	35	21	6	2	4	2
Left	6	31	25	0	2	4	0
	7	31	25	0	2	4	0

Table 29: User I/Os Per Bank for XC3S1000 and XC3S1500 in FG456 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	40	31	0	2	5	2
	1	40	31	0	2	5	2

FG676: 676-lead Fine-pitch Ball Grid Array

The 676-lead fine-pitch ball grid array package, FG676, supports three different Spartan-3 devices, including the XC3S1000, the XC3S1500, and the XC3S2000. All three have nearly identical footprints but are slightly different due to unconnected pins on the XC3S1000 and XC3S1500. For example, because the XC3S1000 has fewer I/O pins, this device has 98 unconnected pins on the FG676 package, labeled as “N.C.” In [Table 30](#) and [Figure 14](#), these unconnected pins are indicated with a black diamond symbol (◆). The XC3S1500, however, has only two unconnected pins, also labeled “N.C.” in the pinout table but indicated with a black square symbol (■).

All the package pins appear in [Table 30](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC1000, XC3S1500 and XC3S2000 pinouts, then that difference is highlighted in [Table 30](#). If the table entry is shaded grey, then there is an unconnected pin on either the XC3S1000 or XC3S1500 that maps to a user-I/O pin on the XC3S2000. If the table entry is shaded tan, then the unconnected pin on either the XC3S1000 or XC3S1500 maps to a VREF-type pin on the XC3S2000. If the other VREF pins in the bank all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S1000 or XC3S1500 to the same VREF voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S1000 through to the XC3S2000 FPGA without changing the printed circuit board.

Pinout Table

User I/Os by Bank

Table 31 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S1000 in the FG676 package. Similarly, Table 32 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S1500 in the FG676 package. Finally, Table 33 shows the same information for the XC3S2000 in the FG676 package.

Table 31: User I/Os Per Bank for XC3S1000 in FG676 Package

FG900: 900-lead Fine-pitch Ball Grid Array

The 900-lead fine-pitch ball grid array package, FG900, supports three different Spartan-3 devices, including the XC3S2000, the XC3S4000, and the XC3S5000. The footprints for the XC3S4000 and XC3S5000 are identical, as shown in Table 34 and Figure 15. The XC3S2000, however, has fewer I/O pins which consequently results in 68 unconnected pins on the FG900 package, labeled as “N.C.” In Table 34 and Figure 15, these unconnected pins are indicated with a black diamond symbol (◆).

All the package pins appear in Table 34 and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S2000 pinout and the pinout for the XC3S4000 and XC3S5000, then that difference is highlighted in Table 34. If the table entry is shaded, then there is an unconnected pin on the XC3S2000 that maps to a user-I/O pin on the XC3S4000 and XC3S5000.

Pinout Table

User I/Os by Bank

Table 35 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S2000 in the FG900 package. Similarly, Table 36 shows how the

available user-I/O pins are distributed between the eight I/O banks for the XC3S4000 and XC3S5000 in the FG900 package.

Table 35: User I/Os Per Bank for XC3S2000 in FG900 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	71	62	0	2	5	2
	1	71	62	0	2	5	2
Right	2	69	61	0	2	6	0
	3	71	62	0	2	7	0
Bottom	4	72	57	6	2	5	2
	5	71	55	6	2	6	2
Left	6	69	60	0	2	7	0
	7	71	62	0	2	7	0

Table 36: User I/Os Per Bank for XC3S4000 and XC3S5000 in FG900 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	79	70	0	2	5	2
	1	79	70	0	2	5	2
Right	2	79	71	0	2	6	0
	3	79	70	0	2	7	0
Bottom	4	80	65	6	2	5	2
	5	79	63	6	2	6	2
Left	6	79	70	0	2	7	0
	7	79	70	0	2	7	0

FG1156: 1156-lead Fine-pitch Ball Grid Array

The 1,156-lead fine-pitch ball grid array package, FG1156, supports two different Spartan-3 devices, namely the XC3S4000 and the XC3S5000. The XC3S4000, however, has fewer I/O pins, which consequently results in 73 unconnected pins on the FG1156 package, labeled as “N.C.” In [Table 37](#) and [Figure 16](#), these unconnected pins are indicated with a black diamond symbol (◆).

The XC3S5000 has a single unconnected package pin, ball AK31, which is also unconnected for the XC3S4000.

All the package pins appear in [Table 37](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S4000 and XC3S5000 pinouts, then that difference is highlighted in [Table 37](#). If the table entry is shaded grey, then there is an unconnected pin on the XC3S4000 that maps to a user-I/O pin on the XC3S5000. If the table entry is shaded tan, which only occurs on ball L29 in I/O Bank 2, then the unconnected pin on the XC3S4000 maps to a VREF-type pin on the XC3S5000. If the other VREF_2 pins all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S4000 to the same VREF_2 voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S4000 to the XC3S5000 FPGA without changing the printed circuit board.

Pinout Table

User I/Os by Bank

Table 38 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S4000 in the FG1156 package. Similarly, Table 39 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S5000 in the FG1156 package.

Table 38: User I/Os Per Bank for XC3S4000 in FG1156 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	90	79	0	2	7	2
	1	90	79	0	2	7	2
Right	2	88	80	0	2	6	0
	3	88	79	0	2	7	0
Bottom	4	90	73	6	2	7	2
	5	90	73	6	2	7	2
Left	6	88	79	0	2	7	0
	7	88	79	0	2	7	0

Table 39: User I/Os Per Bank for XC3S5000 in FG1156 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	100	89	0	2	7	2
	1	100	89	0	2	7	2
Right	2	96	87	0	2	7	0
	3	96	87	0	2	7	0
Bottom	4	100	83	6	2	7	2
	5	100	83	6	2	7	2
Left	6	96	87	0	2	7	0
	7	96	87	0	2	7	0

Revision History

Date	Version No.	Description
04/03/03	1.0	Initial Xilinx release.
04/21/03	1.1	Added information on the VQ100 package footprint, including a complete pinout table (Table 16) and footprint diagram (Figure 8). Updated Table 15 with final I/O counts for the VQ100 package. Also added final differential I/O pair counts for the TQ144 package. Added clarifying comments to HSWAP_EN pin description on page 13. Updated the footprint diagram for the FG900 package shown in Figure 15a and Figure 15b. Some thick lines separating I/O banks were incorrect. Made cosmetic changes to Figure 1, Figure 3, and Figure 4. Updated Xilinx hypertext links. Added XC3S200 and XC3S400 to Pin Name column in Table 18.
05/12/03	1.1.1	AM32 pin was missing GND label in FG1156 package diagram (Figure 16).
07/11/03	1.1.2	Corrected misspellings of GCLK in Table 1 and Table 2 . Changed CMOS25 to LVCMOS25 in Dual-Purpose Pin I/O Standard During Configuration section. Clarified references to Module 2. For XC3S5000 in FG1156 package, corrected N.C. symbol to a black square in Table 37 , key, and package drawing.
07/29/03	1.2	Corrected pin names on FG1156 package. Some package balls incorrectly included LVDS pair names. The affected balls on the FG1156 package include G1, G2, G33, G34, U9, U10, U25, U26, V9, V10, V25, V26, AH1, AH2, AH33, AH34. The number of LVDS pairs is unaffected. Modified affected balls and re-sorted rows in Table 37 . Updated affected balls in Figure 16 . Also updated ASCII and Excel electronic versions of FG1156 pinout.
08/19/03	1.2.1	Removed 100 MHz ConfigRate option in CCLK: Configuration Clock section and in Table 11 . Added note that TDO is a totem-pole output in Table 9 .
10/09/03	1.2.2	Some pins had incorrect bank designations and were improperly sorted in Table 20 . No pin names or functions changed. Renamed DCI_IN to DCI and added black diamond to N.C. pins in Table 20 . In Figure 10 , removed some extraneous text from pin 106 and corrected spelling of pins 45, 48, and 81.
12/17/03	1.3	Added FG320 pin tables and pinout diagram (FG320: 320-lead Fine-pitch Ball Grid Array). Made cosmetic changes to the TQ144 footprint (Figure 9), the PQ208 footprint (Figure 10), the FG676 footprint (Figure 14), and the FG900 footprint (Figure 15). Clarified wording in Precautions When Using the JTAG Port in 3.3V Environments section.
02/27/04	1.4	Clarified wording in Using JTAG Port After Configuration section. In Table 12 , reduced package height for FG320 and increased maximum I/O values for the FG676, FG900, and FG1156 packages.
07/13/04	1.5	Added information on lead-free (Pb-free) package options to the Package Overview section plus Table 12 and Table 13 . Clarified the VRN_# reference resistor requirements for I/O standards that use single termination as described in the DCI Termination Types section and in Figure 3b . Graduated from Advance Product Specification to Product Specification.
08/24/04	1.5.1	Removed XC3S2000 references from FG1156: 1156-lead Fine-pitch Ball Grid Array .
